

BAB IV

PENGHITUNGAN ULANG

4.1 Pemodelan

Sesuai dengan konsep dasar metode elemen yaitu membagi-bagi suatu bagian yang besar menjadi sub-bagian yang lebih kecil, yaitu dengan mengambil bentuk geometri tertentu yang sederhana guna mendekati bentuk struktur bangunan utuh (P.J. Soedarjana, Ir., 1992).

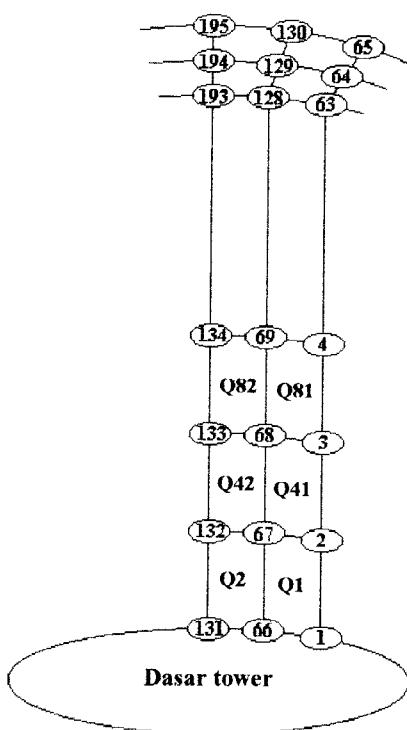

Perlu dikedepankan di sini, bahwa pada elemen tertentu khususnya pada struktur pérkuatan (*lateral support*) terdapat bagian/sisi yang dalam pendekatannya tidak memungkinkan untuk diambil bentuk segi empat yang simetris.

Hal ini dilakukan sebagai upaya agar didapatkan model yang menyerupai bangunan aslinya, disamping dalam studi kasus permasalahan yang dijumpai sangat berbeda kondisinya dengan perencanaan. Dalam perencanaan struktur bangunan, bentuk bangunan dimaksud dapat direncanakan sesuai dengan keinginan dan kebutuhan perencana. Akan tetapi pada studi kasus bangunan telah ada, sehingga bagaimanapun kondisinya, penulis harus sedapat mungkin mengaktualisasikan dan menerjemahkan bentuk bangunan menjadi data masukan pada SAP 90 hingga akhirnya dapat divisualisasikan mendekati kenyataan.

Langkah awal yang dikerjakan dalam menuliskan data masukan yaitu setelah mempelajari gambar bangunan, maka ditentukan koordinat-koordinat dengan meng-

sumsikan badan bangunan tersusun dari elemen-elemen *shell* segi empat, terhadap sumbu-sumbu koordinat global X, Y dan Z (tiga dimensi).

Pada bangunan menara utama penomoran joint dimulai dari nomor joint 1 hingga jomor joint 2600, sedangkan shell dimulai dari nomor shell 1 hingga nomor shell 2560. Seperti dapat dilihat pada gambar berikut,

Gambar 4.1 Penomoran joint dan shell tower utama

Keterangan :

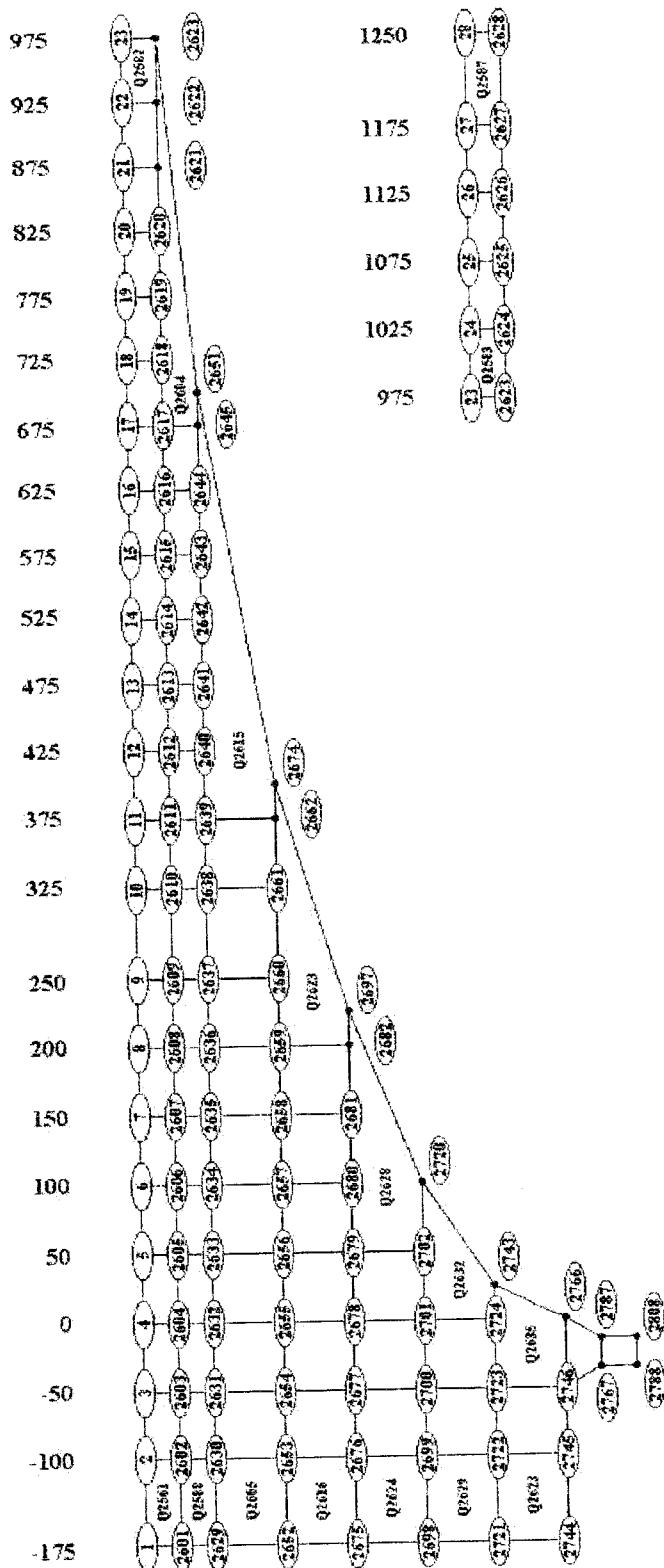

- a. Menara berbentuk lingkaran dengan garis tengah dalam 140 cm.
- b. Keliling menara dibagi menjadi 40 pias, dengan pias pertama dimulai dari nomor joint 1 sampai 65, demikian seterusnya hingga pias ke 40 dengan nomor joint 2536 sampai 2600.

- c. Shell pada menara berbentuk segi empat dengan 2 macam ukuran, yaitu berukuran lebar 11 cm dan tinggi 75 cm, serta lebar 11 cm dan tinggi 50 cm. Adanya dua macam ukuran ini adalah untuk menyesuaikan pembagian shell pada *lateral support* (sayap) sehingga joint-joint pada bagian pertemuan antara sayap dengan menara utama dapat berimpit.
- d. Elemen shell (Q) penomoran secara melingkar, dengan lingkar pertama dimulai Q1 sampai Q40, demikian seterusnya hingga lingkar teratas dimulai Q2521 sampai Q2560

Sedangkan pembagian pada sayap *lateral support* dapat dilihat pada gambar 4.2, dengan keterangan sebagai berikut :

- a. Joint dimulai dari nomor 2601, merupakan lanjutan nomor joint terakhir menara utama yaitu 2600, sedangkan nomor joint 1-28 menunjukkan bagian sayap yang berimpit dengan menara utama.
- b. Shell dilambangkan dengan Q, dimulai dari nomor 2561 yang merupakan ke-lanjutan nomor shell terakhir menara utama.

Tampak pada gambar bahwa bagian-bagian tertentu (untuk mendekati bentuk) dengan tetap mempertahankan bentuk segi empat diambil pendekatan dengan bentuk yang tidak simetris dan terdapat juga segi empat simetris dengan ukuran yang lebih besar dibanding lainnya. Pemilihan bentuk ini dipilih setelah dilakukan beberapa kali percobaan dan dilakukan *running* program, dimana gaya maksimum yang timbul tidak terdapat pada bagian tersebut, sehingga agar joint dan shell tidak terlalu banyak, maka dilakukan penyederhanaan bentuk sebagaimana dapat dilihat pada gambar 4.2 yang merupakan bentuk yang paling mendekati ujud nyata bangunan.

Gambar 4.2 Penomoran joint dan shell pada sayap

Dari penomoran koordinat dan shell yang telah dilakukan di atas, maka selanjutnya dituliskan dalam baris-baris input data sesuai aturan penulisan SAP 90, sebagaimana disajikan berikut ini.
