ABSTRAK

Pada perencanaan struktur gedung bertingkat diperlukan struktur yang aman dan ekonomis.Struktur yang aman dan ekonomis memerlukan perhitungan untuk mendapatkan tulangan dan dimensi yang minimal dalam batas keamanan yang telah ditentukan. Perkembangan ilmu dalam bidang teknik sipil selalu berupaya untuk memperoleh perencanaan strukutur yang optimal, hal ini ditunjukan dengan penggunaaan metode perencanaan ultimate yang dirasa lebih mendekati kenyataan daripada penggunaan metode elastis. Perencanaan dengan struktur beton bertulang pada intinya adalah penggabungan penggunaan bahan beton dan baja tulangan. Dalam struktur yang telah mengalami pembebanan, pada bagian penampang yang mengalami gaya tarik diberikan tulangan baja yang berfungsi untuk menahan gaya tarik , karena beton relatif kecil dapat menahan tarik sehingga diasumsikan beton tidak menahan tarik, sedangkan pada bagian penampang yang mengalami gaya tekan, ditahan oleh beton. Dari perhitungan perencanaan rumah susun pada tugas akhir ini diperoleh hasil : tebal pelat 12 cm dengan rata- rata tulangan ∅8-80, balok dimensi 30/40,30/50,30/60,40/70,50/80 dengan diameter tulangan D22, kolom dimensi 30/30,40/40,60/60,70/70 dengan diameter tulangan D25 dan pondasi telapak dengan diameter tulangan D25.

BAB I

PENDAHULUAN

1.1. Latar Belakang

Pertumbuhan Indonesia yang semakin meningkat banyak menimbulkan berbagai masalah baru. Perumahan sebagai salah satu kebutuhan pokok merupakan permasalahan yang harus ditangani secara serius. Pertumbuhan ekonomi Indonesia yang stabil dan cukup tinggi menjadikan perumahan bukan hanya sekedar tempat berteduh namun kelayakan dan kenyamanan menjadi pertimbangan pokok dalam perencanaan perumahan. Kebutuhan perumahan di pedesaaan tidak terlalu menjadi permasalahan yang serius, tetapi diperkotaan pemenuhan kebutuhan tersebut sangat perlu dipertimbangkan karena menyangkut berbagai aspek .

Yogyakarta sebagai salah satu kota di Indonesia, jumlah penduduknya semakin meningkat dari tahun ke tahun. Daya tarik Yogyakarta sebagai kota wisata, budaya dan pelajar menjadikan Yogyakarta semakin banyak diminati pendatang. Dengan latar belakang tersebut, bangunan-bangunan baru banyak berdiri untuk memenuhi sarana dan prasarana seperti hotel, pusat perbelanjaan, restoran, perkantoran dan lain-lain. Keadaan tersebut menimbulkan masalah ketersediaan lahan.

Perumahan sebagai salah satu kebutuhan pokok manusia perlu direncanakan pemenuhannya dengan mempertimbangkan berbagai aspek. Harga tanah yang semakin mahal menjadi salah satu kendala yang harus diselesaikan untuk mencari alternatif pemenuhan perumahan yang layak dan nyaman.

Salah satu alternatif adalah perumahan yang tidak menggunakan lahan yang luas tetapi mempunyai tata ruang yang layak dan nyaman adalah Rumah Susun.

Pertimbangan biaya dirasa telah memenuhi syarat karena biaya pembangunan rumah susun jika dibandingkan dengan harga tanah relatif kecil. Disamping itu pembangunan rumah susun dapat dilaksanakan ditengah kota atau dipinggiran sehingga waktu tempuh untuk mencapai jantung kota lebih pendek.

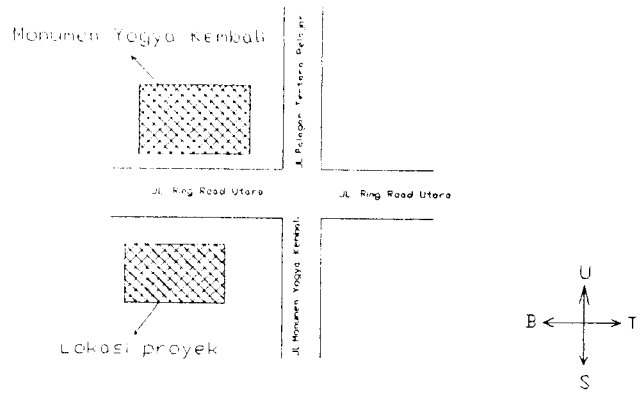
1.2 Batasan Masalah

Perencanaan gedung rumah susun di bangun disekitar Monumen Yogya Kembali. Gedung ini mempunyai bagian gedung dengan dua bagian simetris. Pada tugas akhir ini direncanakan satu bagian gedung, sedangkan gedung dengan portal lift tidak dihitung. Perencanaan ini menggunakan pondasi footplate, dan balok dianalisa dengan anggapan sebagai balok persegi. Mutu bahan yang digunakan pelat : fy=240 MPa, fc'=25 Mpa balok,kolom dan pondasi : fy=400 Mpa, fc'=30 Mpa

Untuk lebih menyakinkan hasil perencanan ini maka kontrol dengan bantuan program SAPCON dari SAP90.

1.3. Lokasi Proyek

Proyek Rumah Susun ini terletak di jalan Ring Road utara sebelah selatan Monumen Yogya Kembali



Gambar 1.1Denah Situasi Proyek

Pemilihan lokasi ini didasarkan pada pertimbangan-pertimbangan sebagai berikut :

1. Letaknya cukup strategis, dikarenakan berada diantara pusat kota dan pemukiman penduduk.
2. Tersedianya jaringan listrik, air minum serta fasilitas-fasilitas lainnya.
3. Relatif dekat dengan pemukiman penduduk.

1.4. Data Teknis Bangunan

Proyek Rumah Susun ini terdiri dari 5 lantai ditambah satu lantai basement dengan perincian penggunaan sebagai berikut :

1. Lantai "basement" digunakan sebagai ruang pengelola, parkir mobil dan sepeda motor, lift, sampah.
2. Lantai pertama, digunakan sebagai ruang serbaguna, kantor, Taman Kanak-Kanak, toko, koperasi, gudang, musholla, pengurus, kamar sewa.
3. Lantai kedua s/d keempat digunakan sebagai kamar rumah susun
4. Lantai kelima digunakan sebagai kamar rumah susun, ruang Water Tank dan ruang mesin lift.

BAB II

PERENCANAAN

2.1 Uraian Umum

Perencanaan suatu gedung haruslah dikerjakan oleh perencana yang mengerti dan menguasai unsur-unsur dari suatu perencanaan itu sendiri, agar gedung yang direncanakan terhindar dari kesalahan-kesalahan yang dapat mengakibatkan kerugian material maupun keselamatan dari pemakai gedung tersebut, sehingga para penghuni merasa nyaman selama berada didalamnya. Disamping itu harus mengetahui dan memahami fungsi dari bangunan yang direncanakan, karena setiap bangunan mempunyai fungsi dan kegunaan yang berbeda-beda.

2.2. Perencanaan Konstruksi

2.2.1. Dasar perencanaan

Sebagai dasar perencanaan gedung ini adalah segi keamanan yang paling utama, baik terhadap beban tetap maupun sementara dengan tidak mengurangi nilai-nilai estetika dari bentuk bangunan yang telah direncanakan.

2.2.2. Peraturan dan standar yang digunakan

Pedoman dari perencanaan gedung ini menggunakan beberapa peraturan yaitu:

1. Tata Cara Perhitungan Struktur Beton Untuk Bangunan Gedung berdasarkan SK SNI-T-15-1991-03.

2. Peraturan Pembebanan Indonesia Untuk Gedung 1983

3. Pedoman Perencanaan Ketahanan Gempa Untuk Rumah Dan Gedung, 1987

4. Peraturan Konstruksi Kayu Indonesia, 1961

2.2.3 Kriteria perencanaan struktur

A. Perencanaan Atap

Atap mempunyai fungsi sebagai penutup bagian atas dari suatu bangunan. Atap pada gedung ini direncanakan menggunakan rangka kayu kalimantan yang di cat dengan oli bekas sebelum digunakan agar tidak dimakan kutu kayu. Kuda-kuda menggunakan kayu dengan pertimbangan biaya yang lebih ekonomis dalam pembuatan awal dan kayu terlindung sehingga tahan lama untuk jangka waktu 20 tahun, disamping itu untuk bentang kuda-kuda 6 meter penggunaan bahan lain tidak ekonomis. Penutup atapnya memakai genteng press dengan peertimbangan estetika bangunan, disamping juga genteng press relatif lebih rapat terhadap kebocoran jika dibanding penutup atap lain yang sejenis. Perencananaan kuda-kuda kayu ini menggunakan perumusan sebagai berikut :

1.Perencanaan gording

-Beban yang bekerja pada gording :

1.Beban angin

2.Beban hidup

3.Beban atap

4. Berat sendiri gording

-Tegangan yang terjadi :

$$\sigma_{lt} = \frac{Mx}{Wx} + \frac{My}{Wy} \leq \bar{\sigma}_{lt} \quad \text{.....(2.1)}$$

-Lendutan yang terjadi :

$$F = \frac{5.q.L^4}{384.E.I} + \frac{P.L^3}{48.E.I} < \frac{1}{200}L \quad \text{.....(2.2)}$$

2.Perencanaan kuda-kuda kayu

-Beban yang bekerja pada kuda-kuda:

2.Beban eternit

3.Beban plafon

4. Berat kuda-kuda (ditaksir)

B. Perencanaan Pelat Lantai

Pelat lantai berfungsi sebagai pendukung beban akibat berat sendiri dan beban berguna yang ada diatasnya. Pelat pada gedung ini direncanakan menggunakan beton bertulang, dengan spesifikasi sebagai berikut :

1. Spasi tulangan (SK-SNI T-15-1991-03 subbab 3.16.6):

   - Jarak bersih antara tulangan sejajar ≥ D atau 25 mm.

   - Jarak bersih antara tulangan sejajar ≤ 3ht atau 500mm

2. Tulangan Susut atau suhu (SK-SNI T-15-1991-03) :

   - Jarak bersih tulangan pembagi ≤ 5ht atau 500 mm.

3. Pelindung beton untuk tulangan (SK-SNI T-15-1991-03 subbab 3.16.12):

   - Lantai yang tidak berhubungan langsung dengan tanah dengan tulangan ≤D16 maka dipakai penutup beton (pb) 20 mm.

   -Lantai yang langsung berhubungan dengan tanah dengan tulangan ≤D16 , maka dipakai penutup beton (pb) 40 mm.

4. Distribusi gaya untuk pelat tumpuan satu arah dapat dianggap sebagai gelagar diatas berbagai tumpuan dan diselesaikan dengan menggunakan persamaan mekanika biasa. Menurut SK-SNI T-15-1991-03 subbab 3.6.6 mengijinkan untuk menentukan distribusi gaya menggunakan koefisien momen untuk mempermudah, tetapi penggunaannya dibatasi untuk syarat-syarat seperti berikut ini :

   -jumlah bentang minimal dua

   - panjang bentang bersebelahan yang paling besar disebelah kiri dan kanan tumpuan tidak boleh 1,2 kali lipat dari besar daripada panjang bentang

bersebelahan yang paling pendek.

- beban harus merupakan beban terbagi merata (distribusi).
- beban hidup harus 3 kali lebih kecil dari beban mati.
- penggunaan koefisien momen diatur sebagai berikut:

  -Untuk momen lapangan : bentang bersih (lu) terletak diantara tumpuan .

  -Untuk momen tumpuan : bentang bersih rata-rata (lu) terletak pada sebelah kiri dan kanan tumpuan.

5. Distribusi gaya untuk pelat 2 arah yang ditumpu oleh ke-4 sisinya adalah merupakan struktur statis tak tentu.

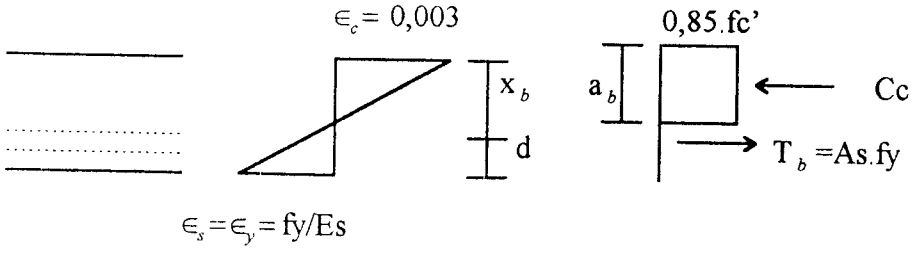
Momen kerja : $Mu = qu.Lx^2.C$ .....(2.8)

6. Menentuan tebal pelat

Menurut SK-SNI T-15-1991-03 subbab 3.2. 5-3 tebal pelat (non praktekan) dapat ditentukan dengan pendekatan sebagai berikut :

$$h_{min} = \frac{\ln x\left(0{,}8 + \frac{fy}{1500}\right)}{36 + 9\beta} \quad \text{.....(2.9)}$$

7. Analisis Tampang



Gambar 2.1 Regangan dan Gaya dalam pelat

dari diagram gaya dalam :

Cc = 0,85.fc'. a_b .b

Jika :

fc' < 30 Mpa → ß1 = 0,85

fc' > 30 Mpa → ß1 = 0,85 - 0,008 (f c' - 30)

T_b = As.fy = ρ .b.d. fy .....(2.12)

Persamaan kesetimbangan : Σ H = 0 (pers 2.4 dan 2.5)

$$\rho b = \frac{0{,}85.fc'.\beta_1}{fy}\frac{x_b}{d}$$

ρ_{min} = 1,4/fy ..... (2.14)

$$\rho_{perlu} = \frac{1}{m}\left[1-\sqrt{1-\frac{2.m.Rn}{fy}}\right] \quad \text{.....(2.16)}$$

syarat $\rho_{min} < \rho_{perlu} < \rho_{max}$

8.Perhitungan tulangan pokok

As = ρ_{perlu}. b. d ..... (2.17)

jarak tulangan = $A_{\varnothing}$ .100 / As ..... (2.18)

9. Perhitungan tulangan susut

Menurut SK SNI T-15-1991-03 subbab 3. 16. 12 :

Asbg = (0,0018. 400. b.h) / fy ..... (2.20)

Vc = ($\sqrt{f'c}$ / 6) bw. d ..... (2.23)

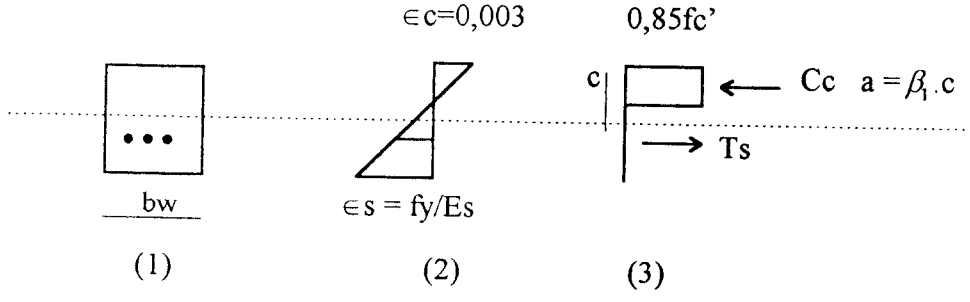
$\varnothing$ Vc > Vu

Vu = gaya geser yang terjadi pada balok

C. Perencanaan Balok

Balok merupakan batang struktural yang didesain untuk menahan gaya-gaya yang bekerja dalam arah transversal terhadap sumbunya. Balok pada gedung ini menggunakan beton bertulang.

Dalam pelaksanaan dilapangan pada umumnya pengecoran balok dilakukan secara monolit dengan pelat, sehingga lendutan yang terjadi pada balok akan didistribusikan pula ke pelat. Dengan demikian tegangan tekan akan terjadi di kedua belah pihak. Untuk itu kita perlu mengetahui berapa bagian dari lebar pelat yang ikut menerima distribusi lendutan dari gaya-gaya balok.



Gambar 2.2 Regangan dan Gaya dalam balok

Keterangan :

Gambar 3 : Diagram tegangan

1. Penentuan syarat batas Tulangan

-Spasi tulangan (SK SNI T-15-1991-03 , : Jarak bersih antara tulangan sejajar > D atau 25 mm.

2. Kontrol Dimensi

Pada umumnya dalam suatu perencanaan struktur terlebih dahulu kita tentukan dimensinya, sehingga dimensi tersebut harus kita kontrol untuk mengetahui kelayakannya.

3. Kontrol geser (SK SNI T-15-1991-03 subbab 3. 4. 11)

Vu_{max} → dari hasil analisis struktur

$Vc = \sqrt{f'c} / 6.\ bw.\ d$

$Vs = 2.\ \sqrt{f'c} / 3.\ bw.d$

Syarat : $Vu_{max} \leq \varnothing\ (Vc + Vs)$

4. Kontrol Torsi → kalau ada yang menyebabkan torsi (SK SNI T-15-1991- subbab 3. 3. 4 - 22)

Tu_{max} → dari hasil analisis struktur dipilih yang terbesar yang paling menentukan.

$\Sigma x^2Y = bw^2.h + (bf-bw)^2.hf$ → balok tepi

$= bw^2 . h + 2. (bf-bw)^2.hf$ → balok tengah

$Ct = (bw.d / (\Sigma x^2.Y)$

Tulangan torsi harus disediakan paling tidak (bt+d) diluar titik teoritis yang diperlukan bt = bw - 2.pb - 2.Ds

d = h -2.pb - 2.Ds - 1/2.D

Pada umumnya torsi terjadi bersamaan dengan gaya geser,maka hitungan tahanan tegangan torsi (Tc) sebagai berikut :

Hitung Tc → jika terjadi gaya lintang

$$Tc = \frac{(\sqrt{f'c}/15)\Sigma x^2 y}{\sqrt{1+\left(\frac{0{,}4Vu}{CtTu}\right)^2}} \qquad \text{.....(2.24)}$$

Hitung Tc ==> torsi murni (Vu = 0)

$Tc = (\sqrt{f'c}/15).\Sigma x^2 y$

$Ts = Tu/\varnothing - Tc$

Syarat : $Ts < 4Tc$

5. Menentukan momen rencana

MD = momen akibat beban mati

ML = momen akibat beban hidup

MG = momen akibat beban gempa

Mu = 1,2.MD + 1,6.ML ..... (2.25)

Mu = 0,9.D ± E ..... (2.26)

Mu = 1,05.(D + LR ± E) ..... (2.27)

Mn = Mu / ∅

Kontrol kapasitas tampang :

Mn_{tot} = 0,85. f'c. b. hf. (d - 1/2.hf) > Mn ..... (2.28)

6. Perencanaan Tulangan Pokok

Dari rumus 2.13 :

$$\rho b = \frac{0{,}85.fc'.\beta_1}{fy}\frac{600}{600+fy}$$

Menurut SK SNI T-15-1991-03 subbab 3. 3. 5 :

ρ_{min} = 1,4 / fy

ρ_{max} = 0,75. ρb

m = fy / (0,85.f'c)

Rn = Mn / (b.d²)

$$\rho_{perlu} = \frac{1}{m}.\left[1-\sqrt{1-\frac{2.m.Rn}{fy}}\right]$$

Jika $\rho_{min} < \rho_{perlu} < \rho_{max}$ → tulangan tunggal

As = ρ_{perlu}. bw. d

A∅ = ¼. π .D²

N = As / A∅ → dibulatkan keatas

Asb = N.A∅ > As

d_{aktual} = h - pb - Ds - 1/2 D

$\rho_{min} < \rho_{aktual}$ = Asb / (bw.d_{aktual}) < ρ_{max}

Jarak horisontal : x = (bw - 2.pb - 2.Ds - N.D) / (N-1) > 2,5 cm

Jarak vertikal : Y= 2,5 cm ; jarak maksimum tulangan samping ≤ 30 cm

kontrol kapasitas :

Cc = 0,85. fc'. bw. a

Ts = Asb. fy

Syarat : Cc = Ts ==> a = ...

Mn tot = Ts. (d - 1/2.a) > Mn ==> tulangan desak diabaikan.

Kontrol :

c = a / ß1 > hf ==> pemisalan sebagai balok T murni

< hf ==> pemisalan sebagai balok T biasa ,maka bw diganti bf

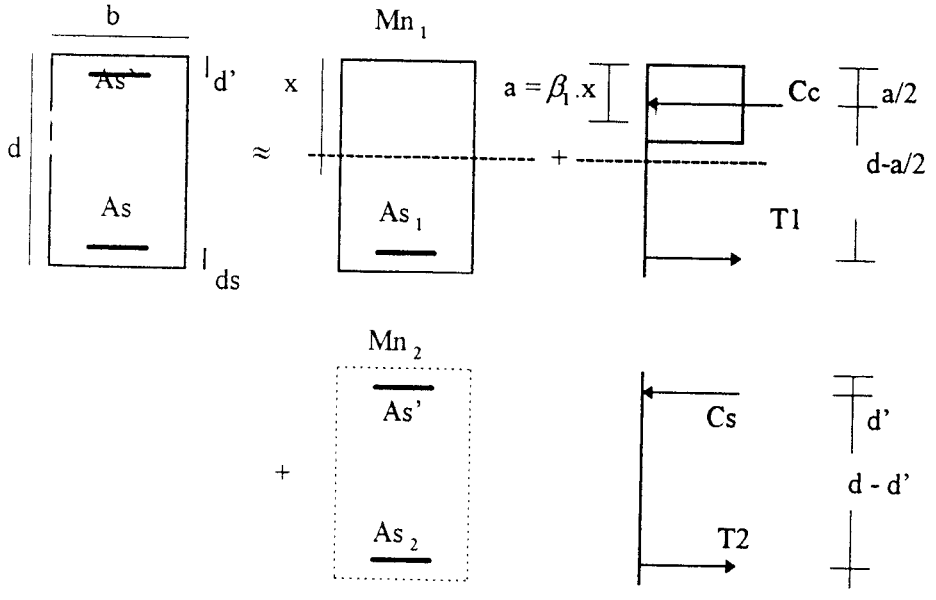
Jika $\rho_{perlu} > \rho_{max}$ ==> tulangan rangkap

Ada dua alternatif penyelesaian :

a. sesuaikan ukuran penampang balok (diperbesar)

b. bila tidak memungkinkan, maka dipasang tulangan rangkap sehingga tulangan desak diperhitungkan.

Analisa balok dengan tulangan rangkap



Gambar 2.3 Analisa balok bertulangan rangkap

$As = As_1 + As_2$ dan $T = T1 + T2$

$$T = Cc + Cs$$

Prosedur yang logis, untuk perencanaan penampang pesegi dengan tulangan rangkap:

1. menghitung kapasitas / momen nominal penampang dengan tulangan tarik saja, dengan menggunakan tulangan tarik maksimum yang diijinkan.

$$Mn_1 < Mn$$

$As_1 = \rho . b . d$

2. kelebihan momen

$Mn_2 = Mn - Mn_1$

ditahan oleh tambahan tulangan tarik bersama dengan tulangan tekan

$$Cs = \frac{Mn2}{d - d'}$$

luas tulangan tekan : $As = \frac{Cs}{f's - 0{,}85 . f'c}$

dengan : fs' = fy, bila $\varepsilon' s \geq \varepsilon y$ dan fs' = Es . $\varepsilon' s$ bila $\varepsilon' s < \varepsilon y$

dari keseimbangan gaya dalam diperoleh T2 = Cs , sehingga

Tambahan tulangan tarik :

$$As_2 = \frac{T2}{fy}$$ (baja tarik telah leleh)

Luas tulangan tarik : $As = As_1 + As_2$

7. Perencanaan tulangan torsi dan geser

Dalam prakteknya torsi murni hampir tidak pernah terjadi, umumnya penampang harus menyalurkan torsi maupun gaya lintang.

Persyaratan :

- Pengaruh torsi harus diperhitungkan bersama geser dan lentur bila

$$Tu > \varnothing . \left[(\sqrt{f'c} / 20) . \Sigma x^2 . y \right]$$

- Bila momen torsi berfaktor (Tu) yang bekerja lebih besar dari $0{,}6.\left[(\sqrt{fc'}/24).\Sigma x^2.y\right]$,maka luas tulangan tertutup minimum harus dihitung sebesar Avt + 2. At = (bw.s) / (3 . fy)

- Spasi sengkang terhadap torsi dihitung tidak boleh lebih dari nilai yang paling kecil antara 1/4 (x1 + y1) atau 300 mm.

x1 = bw - 2. pb - Ds → jarak ke pusat-pusat sengkang

y1 = hk - 2.pb - Ds → jarak ke pusat-pusat sengkang

-Perhitungan penulangan :

Kontrol : Tu > 0,6. $\sqrt{fc'}\Sigma x^2 y/24$

Kontrol terhadap geser :

$$Vc = \frac{(\sqrt{f'c}/6).bw.d}{\sqrt{\left(1+\frac{2{,}5.Ct.Tu}{Vu}\right)^2}} \qquad \text{.....(2.29)}$$

Jika Vu < ∅.Vc → tidak perlu tulangan geser

Jika Vu > ∅. Vc → perlu tulangan geser, maka :

vs = (Av. fy. d) / s → Av / s = vs / (fy. d)

vs = tegangan geser

Kontrol terhadap torsi :

$$Tc = \frac{(\sqrt{fc'}/15).\Sigma x^2.Y}{\sqrt{\left(1+\frac{0{,}4.Vu}{Ct.Tu}\right)^2}}$$

Jika Tu < ∅.Tc → tidak perlu tulangan torsi

Jika Tu > ∅ Tc → perlu tulangan torsi, maka :

Ts = (At. α t.x1.y1.fy) / s

α t = (2 + y1/ x1) / 3 < 1,5

At / s = Ts / (α t .x1. y1. fy) = (Tu/ ϕ - Tc) / (α t. x1.y1.fy)

Spasi tulangan sengkang

$Sx = (Av / s + 2.At / s) > Sx_{min} = bw / (3.fy)$

Spasi = $(2.\ As\varnothing) / Sx < 1/4.(x1 + y1)$ atau 300 mm

dengan : $As\varnothing = 1/4.\ \pi .Ds^2$

8. Perencanaan tulangan geser murni

Perencanaan ini dilakukan bila balok yang ditinjau tidak terdapat torsi hanya geser murni saja.

$vu = Vu / (bw.d)$

$\varnothing.vc = \varnothing.\sqrt{f'c}\ / 6$

Jika $vu > \varnothing.vc$ → harus diberi tulangan geser

-Kontrol lebar retak :

$\varnothing.Vs = Vu - \varnothing.Vc < 2/3\sqrt{fc'}$

$Av = (Vu - \varnothing.Vc).bw.y / (\varnothing.fy) > Av_{min} = (bw.y) /(3.fy)$

spasi = $(As\varnothing.100)/Av$

9. Analisis kapasitas tampang geser dan torsi

$(Av / s + 2.At / s)_{aktual} = (2.As\varnothing) / Sx$

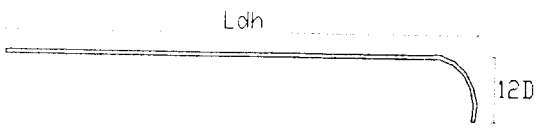
$$(Av / s)' = \frac{(Av / s).(Av / s + 2At / s)_{aktual}}{(Av / s + 2At / s)}$$

$Vs = (Av/s)'.\ fy.\ d$

$\varnothing.(Vc + Vs) > Vu$ → aman

10. Panjang pengangkuran

Digunakan kait standar 90 ° untuk ujung penghabisan



Gambar 2.4 Kait standar SK SNI T-15-1991-03 bengkokan 90 °

$Ldh = (100.D) / \sqrt{f'c}$

Faktor-faktor reduksi :

1. kuat leleh (kl) = 1

2. Tulangan lebih (k2) = As_{perlu} / As

maka : Ldh' = ldh.(kl). (k2) > Ldh_{min} = 8D

11. Sambungan lewatan

Sambungan lewatan digunakan untuk lewatan tulangan atas menerus pada daerah tekan.

Ldb = (D.fy) / (4. $\sqrt{fc'}$) > 0,04.D.fy

D. Perencanaan Kolom

Kolom berfungsi meneruskan beban ke pondasi bangunan yang ada di bawahnya. Kolom gedung ini menggunakan bentuk persegi beton bertulang dengan ukuran disesuaikan beban yang dipikul oleh kolom tersebut.

Dalam merencanakan struktur suatu kolom kita dapat meninjau dalam dua bentuk keadaan yaitu :

a. Kolom sentris yaitu kolom yang hanya mengalami gaya normal (gaya aksial tekan) dan bersendi pada satu ujung saja.

b. Kolom eksentris yaitu kolom yang dipengaruhi oleh dua gaya momen lentur dan aksial, hal ini disebabkan karena kolom merupakan bagian struktural yang berhubungan kaku dengan komponen horisontal (balok).

Dasar-dasar perhitungan kolom yang diberikan beban aksial dan momen lentur pada prinsipnya sama dengan dasar anggapan dalam perencanaan terhadap lentur murni. Dasar-dasar anggapan tersebut antara lain :

a. beton tidak dapat menahan gaya tarik.

a. beton tidak dapat menahan gaya tarik.

b. perpanjangan dan perpendekan yang terjadi pada beton serta tulangan dianggap berbanding lurus dengan jaraknya terhadap garis netral.

Berikut ini diberikan langkah-langkah perencanaan kolom portal :

1.Spasi tulangan (SK SNI T-15-1991-03 subbab 3. 16.6)

-Jarak bersih antara tulangan sejajar > D atau 25 mm

2. Penentuan spesifikasi :

Tentukan beban kerja kolom

M1b = momen ujung atas kolom karena beban vertikal

M2b = momen ujung bawah kolom karena beban vertikal

M1s = momen ujung atas kolom karena beban horisontal

M2s = momen ujung bawah kolom karena beban horisontal

Pu = gaya aksial ultimit

Σ PU = jumlah gaya aksial ultimit yang terjadi

Σ Pc = jumlah gaya aksial kritis

ß = faktor reduksi beban = 1,2D / (1,2D + 1,6L)

φ = faktor reduksi kekuatan

3. Tentukan ukuran balok dan kolom lainnya :

-lebar balok (lb)

-tinggi balok (hb)

-panjang balok (Lb)

-lebar kolom (lk)

-tinggi kolom (hk)

-panjang kolom (Lk)

4. Perhitungan :

-Tentukan inersia :

$Igb = (lb.hb^3)/12$

$Igk = (lk.hk^3)/12$

-Tentukan kekakuan kolom dan balok :

$Ec = 4700.\sqrt{fc'}$ (Mpa)

$EIb = (Ec.Igb) / (5.(1+ß))$ .....(2.30)

$EIk = (Ec.Igk) / (2,5.(1+ß))$ .....(2.31)

-Tentukan kekakuan relatif :

$\psi = \Sigma (EIk1/Lk1) / \Sigma (EIb1/Lb1)$ ..... (2.32)

$\psi m = (\psi 1 + \psi 2)/2$

Jika $\psi m < 2 \Rightarrow k = (20 - \psi m)/20.\sqrt{(1+\psi m}$ .....(2.33)

Jika $\psi m > 2 \Rightarrow k = 0,90.\sqrt{(1+\psi m}$ ..... (2.34)

Cara lain untuk menentukan nilai k dapat melalui nomogram berikut dengan cara memplotkan nilai ψ 1 dan ψ 2 kemudian tarik garis dari nilai keduanya didapat nilai k yang dicari.

-Tentukan kelangsingan kolom

$r = 0,3.hk$

Jika $k. Lk/r < 22 \rightarrow$ kolom tidak langsing

Jika $22 < k.\ Lk / r < 100 \rightarrow$ kolom langsing, maka ada faktor pembesaran momen.

Tentukan dulu :

$$Pc = \pi^2\ (Ec.Ik)/(k.Lk)^2 \quad \ldots\ldots (2.35)$$

$$\delta b = 1/\ (1-(Pu\ /\varnothing .Pc)) > 1 \quad \ldots\ldots (2.36)$$

$$\delta s = 1/(1-(\Sigma\ Pu\ /\varnothing .\Sigma\ Pc)) > 1 \quad \ldots\ldots (2.37)$$

$Mn = Mc\ /\varnothing$

$e = Mn/Pu > (15 + 0{,}03.\ hk)$

Jika $k.\ Lk\ ./r > 100 \rightarrow$ perbaiki dimensi beton

-Tentukan jumlah tulangan :

Cara I (memakai rumus)

Dari rumus :

$m = fy\ /\ (0{,}85.f'c)$

$Rn = M_{max}\ /\ (b.d^2) \rightarrow$ M_{max} dipakai $Mu = 1{,}2.Md + 1{,}6.ML$

Jika kolom tidak langsing atau Mn jika kolom langsing.

$$\rho_{perlu} = \frac{1}{m}\left(1-\sqrt{1-\frac{2.m.Rn}{fy}}\right)$$

$As = \rho_{perlu}.\ b.\ d \rightarrow$ $d = hk - pb - 1/2D - Ds$

D = diameter tulangan pokok

$Asb = N.A\varnothing \Longrightarrow$ N untuk 1 sisi

$\rho b = Asb / (b.d)$

Syarat $0,01 < \rho b < 0,04 \Longrightarrow$ Jika $\rho b < 0,01$ maka perbanyak jumlah tulangan

Cara II (memakai diagram interaksi Gideon Kusuma)

-Tentukan $M_{max} \rightarrow$ seperti cara I

-Tentukan Pu

$et = M_{max} / Pu > (15+0,03.hk)$

-Tentukan Agr = b . h

-Tentukan nilai $\dfrac{Pu}{\varnothing.Agr.0,85.fc'} > 1$ ..... (2.37)

-Tentukan nilai $\dfrac{Pu}{\varnothing.Agr.0,85.fc'}\dfrac{et}{hk} > 1$ .....(2.38)

-Tentukan d'/h $\rightarrow$ d'=pb + Ds + 1/2D

Plotkan nilai (2.37) dan (2.38) ke dalam diagram interaksi kolom pada buku Grafik dan Tabel Perencanaan Beton Bertulang oleh Gideon Kusuma, maka akan diperoleh nilai r

-Tentukan nilai β_1

Jika :

fc' < 30 Mpa $\rightarrow$ $\beta_1 = 0,85$

fc' > 30 Mpa $\rightarrow$ $\beta_1 = 0,85 - 0,008 (f c' - 30)$

$\rho_{perlu} = \beta_1 . r$

As = ρ_{perlu} . b. d → d = hk - pb - 1/2D - Ds

N = As/A∅ → A∅=1/4. πD^2 → dibulatkan keatas

Asb = ½. N. A∅ → N untuk 2 sisi

ρb = Asb/(b. d)

Syarat 0,01 < ρb < 0,04 → jika ρb < 0,01 maka perbanyak jumlah tulangan

-Menentukan kapasitas tampang :

Dari rumus :

Cb = $\in$c / ($\in$c+ $\in$c) = 0,003 / (0,003+ (fy / 200.000))

= 600 / (600+fy).d

ab = β_1. cb

f 'sb = 600. (Cb-d') / C b

Jika f 'sb < fy maka :

Pnb = (0,85 .fc' .ab .b) + (As'. f' sb) - (As. fy) ..... (2.39)

Mnb = 0,85. fc'.ab. b. (1/2 h + 1/2 ab) + As'. f 'sb (1/2 h - d') + As.fy.

+ (d -1/2 .h) .....(2.40)

Jika f 'sb > fy, maka :

Pnb = (0,85. fc'. ab. b) + (As'. f'sb) - (As. fy) .....(2.41)

Mnb = 0,85. fc'. ab. b. (1/2. h + 1/2. ab) + As'.f'y (1/2h - d')+ As. fy .

(d -1/2.h) ..... (2.42)

eb = Mnb / Pn b

-Menentukan jenis keruntuhan dengan rumus Whitney

-Jika e > eb → keruntuhan tarik

Dari rumus :

m = fy / (0,85.fc')

$$Pn = 0{,}85.fc'.b.d\left[\frac{h-2e}{2d}+\sqrt{\left(\frac{h-2e}{2d}\right)^2+2m\rho\left(1-\frac{d'}{d}\right)}\right] \quad \text{.....(2.43)}$$

a = Pn / (0,85. fc'. b)

c = a/ β_1

f 'sb = 600 (c - d') / c > fy

ϕ.Pn > Pu → Ok

Jika ϕ.Pn < Pu, maka perbanyak jumlah tulangan

- Jika e < eb → keruntuhan tekan

$$Pn = \frac{A's.fy}{[e/(d-d')]+0{,}5}+\frac{b.h.f'c}{(3he/d^2)+1{,}18} \quad \text{.....(2.44)}$$

ϕ.Pn > Pu → Ok

Jika ϕ.Pn < Pu, maka perbanyak jumlah tulangan

- Kontrol tulangan

-Kontrol jarak vertikal

y = hk - 2.pb - 2.Ds - 2.D < 30 cm

E. Perencanaan Pondasi

Pondasi merupakan struktur bawah suatu bangunan yang berfungsi untuk meneruskan berat dan beban bangunan pada tanah dasar. Dimensi fondasi harus sedemikian, sehingga tanah dasar mampu mendukung beban yang berada diatasnya, dan penurunan yang terjadi masih dalam toleransi yang aman bagi bangunan.

Berdasarkan data hasil pengujian dilapangan dan pengujian di laboratorium, yaitu lapisan tanah dibawah 1,00 meter kepadatan tanah sedang bahkan kedalaman 3,00 meter kepadatan lunak dan tinggi muka air tanah pada kedalaman 3,00 meter maka jenis pondasi yang sesuai untuk Rumah Susun di Yogyakarta pondasi Foot Plate

Dengan menggunakan pondasi Foot Plate dengan dukungan ujung yang dalamnya sekitar 8,00 meter, dan mempunyai daya dukung tiang sebesar kapasitas dukung struktur tiang. Tebal fondasi diatas tulangan bawah tidak boleh kurang dari 150 mm.

Daya dukung tanah izin : $\sigma = 300KN / m^2$

-Perencanaan dimensi pelat

q = berat tanah + berat pondasi

$\sigma_{netto} = \sigma - q$; σ = daya dukung tanah

$\sigma_{netto} \geq P/A$; $A = b^2$

Kontrol daya dukung :

$\sigma \geq P/A + q$; P = gaya aksial kolom

Perencanaan tebal pelat

$Vu = \phi . Vc$

$= \phi . \sqrt{fc'} . b . d / 6$ ..... (2.45)

$Vu = \sigma_{netto} . (x-d) . b$ .....(2.46)

dengan x = tebal taksiran 1,5.D

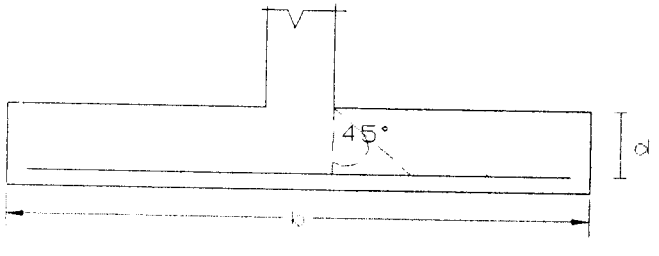
dari persamaan (2.45) dan (2.46) diperoleh $d > d_{min} = 150$ mm

Tebal pelat (t) = d + 1,5.D + pb ; D = diameter tulangan

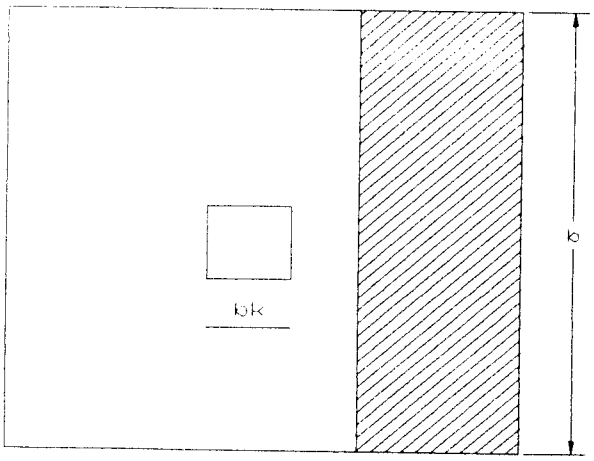
pb = penutup beton

Kontrol terhadap kuat geser

a. Geser balok



Gambar 2.5 Geser pondasi



Gambar 2.6 Daerah kritis geser pondasi

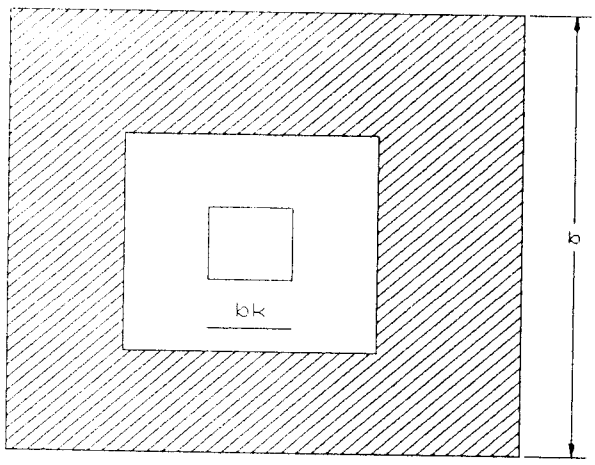
$d = t - \frac{1}{2}.D - pb$

$Vu = (P/A).\ A_{arsiran}$

$Vc = \sqrt{fc'}\ .\ b.\ d\ /6$

syarat : $\phi.Vc \geq Vu$

b.Geser Pons

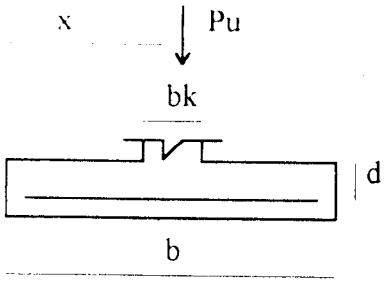


Gambar 2.7 Geser pons pondasi

$Vc = (\ 1+2/\beta_c\ )\ (\sqrt{fc'}\ .\ b.d/6 \quad ;\ \beta_c = hk\ /bk$

$Vu = \sigma_{netto}\ .\ A_{arsir} \quad$; syarat : $\phi.Vc \geq Vu$

Perencanaan penulangan berdasarkan momen lentur



$x = ½.(b-bk)$

$Mu = ½.(P/A).b.x^2$

Gambar 2.8 Beban aksial pada pondasi

$$\rho b = \frac{0{,}85.fc'.\beta_1}{fy}\frac{600}{600+fy}$$

Menurut SK SNI T-15-1991-03 subbab 3. 3. 5 :

$\rho_{min} = 1{,}4 / fy$

$\rho_{max} = 0{,}75.\rho b$

$m = fy / (0{,}85.f'c)$

$Rn = Mn / (b.d^2)$

$$\rho_{perlu} = \frac{1}{m}\left[1-\sqrt{1-\frac{2.m.Rn}{fy}}\right]$$

Syarat $\rho_{min} < \rho_{perlu} < \rho_{max}$

$As = \rho_{perlu}.\ bw.\ d$

jarak tulangan = $(¼.\pi.D^2.100)/As$

-Balok - balok pengikat pada pondasi

Bila tidak digunakan perhitungan analisa dinamik struktur bagian bawahnya maka balok-balok pengikat dapat direncanakan terhadap gaya longitudinal tarik/tekan sebesar 10% dari beban vertikal kolom dimana balok pengikat tersebut bertemu.

BAB IV

PEMBAHASAN

4.1 Umum

Pada gedung bertingkat perlakuan struktur akibat beban menyebabkan terjadinya distribusi gaya. Biasanya untuk mempersingkat perhitungan perencana menganggap elemen-elemen tertentu pada bangunan portal memiliki kesamaan, sehingga hasil dari perhitungannya sama untuk elemen-elemen tersebut.

Perencanaan Rumah Susun menggunakan bantuan program SAP90 untuk memperhitungkan momen yang terjadi dan untuk mengontrol hasil dari luas penulangan.

Perencanaan Rumah Susun ini menggunakan spesifikasi bahan sebagai berikut:-pelat menggunakan spesifikasi Beton : fc' = 25 Mpa

Baja : fy = 240 MPa

-balok dan kolom serta pondasi menggunakan spesifikasi:

Beton : fc' = 30 Mpa

Baja : fy = 400 Mpa

Peningkatan mutu bahan dan pengaruh gempa pada perencanaan Rumah Susun ini, mempengaruhi momen-momen yang terjadi.

4.2 Atap

Perencanaan kuda-kuda untuk atap untuk bentang 6,4 m paling efisien menggunakan bahan dari kayu. Kelemahan menggunakan bahan kayu pada usia penggunaannya yang relatif lebih pendek umurnya dibanding baja. Untuk

menyelesaikan masalah tersebut menggunakan cara mengolesi dengan oli bekas, sehingga hama kayu tidak merusak.

4.3 Pelat

Pada bangunan ini tebal pelat lantai adalah 120 mm dan lantai basement 200 mm. Menggunakan diameter tulangan pokok 8 mm dan tulangan bagi 6 mm. Untuk menahan beban tembok yang berada pada tengah-tengah bentang dilakukan dengan cara menganggap pelat selebar 0,5 m sebagai balok. Jika ditahan dengan balok anak akan mempengaruhi artistik bangunan.

4.4 Balok

Spesifikasi bahan yang digunakan fc'=30 Mpa dan fy =400 Mpa. Pada lantai ke-3 ada dimensi balok 50/80, hal ini disebabkan ada kolom menumpang pada balok tersebut. Dimensi balok yang relatif besar mengakibatkan penggunaan tulangan geser menjadi minimal. Torsi pada balok relatif kecil karena luasan pelat hampir sama tetapi pada balok tepi akibat torsi diperhitungkan. Untuk memperkecil luasan beban pelat agar momen dan lendutan yang terjadi kecil, maka dibagi dengan balok anak

4.5 Kolom

Spesifikasi bahan yang digunakan fc'=30 Mpa dan fy = 400 Mpa. Kolom pada sisi tepi beban aksial kecil momen yang terjadi besar banyak terjadi patah tarik sedang pada kolom tengah sebaliknya.

4.6 Pondasi

Spesifikasi bahan yang digumakan fc'=30 Mpa dan fy=400Mpa. Pondasi direncanakan dengan foot plate dan memperhitungkan momen yang terjadi karena anggapan tumpuan pondasi sebagai jepit.Beban basement ditahan oleh tanah dengan daya dukung tanah 20 Kg/cm2, sedangkan beban basement diatas luasan pelat pondasi ditahan oleh pondasi.

Tie Beam (balok pengikat) tidak diperhitungkan terhadap momen karena anggapan bahwa momen yang terjadi pada kaki pondasi telah ditahan oleh pondasi. Tie Beam diperhitungkan menahan gaya aksial desak dan tarik sebesar 10% dari beban aksial kolom (Gideon,jilid 1hal 245)

BAB V

KESIMPULAN DAN SARAN

5.1 Kesimpulan

Berdasarkan hasil perhitungan dan pembahasan pada bab-bab sebelumnya, pada tugas akhir ini dapat diambil beberapa kesimpulan sebagai berikut :

1. Hasil penulisan dapat dipakai sebagai gambaran jika akan dibangun rumah susun di Yogyakarta.

2. Untuk perhitungan jumlah tulangan struktur kolom menggunakan metode diagram Interaksi dimana antara beban terfaktor (Pn) dan momen terfaktor (Mn) akan terjadi suatu interaksi untuk mendapatkan rasio tulangan (ρ)dan rasio tulangan yang didapat kurang dari 2%

3. Pada tugas akhir ini untuk menyakinkan bahwa hasil perencanaan struktur aman maka menggunakan perbandingan dengan perhitungan cara yang lain yaitu dengan bantuan program SAP90 (SAPCON). Dari hasil perhitungan didapat tulangan pokok hampir sama dengan menggunakan SAPCON dan kondisi masih aman, tetapi untuk tulangan geser lebih aman menggunakan hasil dari SAPCON.

4. Pada pelat jika menggunakan mutu baja rendah fy =240 MPa akan diperoleh ρ_{min} yang lebih besar.

5. Beban aksial yang ditahan oleh pondasi dan daya dukung tanah menentukan jenis dan dimensi pondasi yang akan digunakan Beban aksial yang besar menyebabkan dimensi pondasi besar.

6. Apabila dimensi balok dan kolom berubah dari perencanaan awal, maka harus dihitung ulang analisa strukturnya , karena kekakuan dan distribusi gaya-gaya yang terjadi berubah.

5.2 Saran

Dengan mempertimbangkan dari hasil perhitungan dan pembahasan maka dapat diberikan beberapa saran tugas akhir ini sebagai berikut :

1. Pada tugas akhir ini perlu diadakan perhitungan sampai tahap akhir (RAB), sehingga dari segi biaya dapat diketahui biaya yang diperlukan untuk pembangunan gedung rumah susun ini.

2. Perlu adanya perhitungan redesain dengan peningkatan spesifikasi bahan yang lain, sehingga dapat diketahui sejauh mana efisiensi bahan yang digunakan.

3. Apabila beban aksial yang didukung pondasi sangat besar sehingga tidak dapat ditahan oleh pondasi telapak, maka perlu direncanakan pondasi tiang pancang yang kapasitasnya lebih besar.

4. Bentuk dimensi kolom sebaiknya disesuaikan dengan besar momen yang terjadi agar diperoleh dimensi yang ekonomis.

5. Pada pelat sebaiknya menggunakan diameter tulangan ∅ 10 agar diperoleh jarak antar tulangan tidak terlalu rapat.
