STATEMENT OF FREE PLAGIARISM

Herein I declare the originality of this thesis; there is no other work which has been presented to obtain any university degree, and in my concern there is neither one else's opinion nor published written work, except acknowledgement quotation relevant to the topic of this thesis which have been stated or listed on the thesis bibliography.

If in the future this statement is not proven as it supposed to be, I am willing to accept any sanction complying to the determinated regulation for its consequence.

ACKNOWLEDGEMENT

Alhamdulillahirabbil'alamin, thanks Allah for all the blessing, protection and chance given to me and *Shalawat* and *salaam* for the prophet Muhammad SAW, the greatest inspiration, therefore the thesis is being completed. I would like to give appreciation for those who give contribution to the completion of the thesis.

My sincere appreciation goes to Mr. Hadri Kusuma, Dr., MBA, my content advisor for his help, comments, problem solving in processing my data and advice during my thesis writing. Then, I also present special thanks to Katarina Widiastuti, SS., my language advisor for her suggestion, comments, and time and support in making me confidence during the consultation time.

I would like to extend my gratitude to all lecturers in Economic Faculty Islamic University of Indonesia for the knowledge, motivation and experience given to me during my study in this faculty.

I would like to convey my sincere gratitude to all people around me that always give me inspiration, spirits, prayers, and motivation, time and experience together:

1. My lovely parents. Dad (H. Kunarto) and Mom (Hj. Etty Purwati) deepest thank for the prayers, sacrifice that have made to give the best for me (*I'm proud of being your daughter*). Mom and Dad, I always try to be the best for both of you and I want you proud of me. You are my teacher, my friends and my inspiration. You teach me how to face the life and struggle my destiny in my palm hand and build my own life, thanks dad, thanks mom, you are the part of my life.
2. My sister, Dina, who always makes me miss you. My little sister that always make stubborn and trouble act. But without you it will not be funny and give colorful day in my life.
3. My big family, my grand mother, I grew up and learn everything in this life. And also thank you for the support and prayer. For Pakdhe, Budhe, Om, and Tante thanks for the prayer and helpful.

4. My cousins, Mbak Andin, Mas Adi, Seno, Mbak Susi and Mbak Dewi, thanks for the prayer and to become my lovely cousin that always give support. For Emma, my cousin that is always being together with me from a baby till now, sorry I must leave you sooner than you. When will you follow me? Stop playing and being serious girl. Let's meet again in Jakarta. For Dita and Tio, my coolest cousins, thanks for everything and the support. I'm sorry that I always make both of you busy in the Bandung.
5. My childhood friends, Echa, Icha, Putri, Wanda and Dhani, we are now separated by distance but hopefully our hearth are close. Thanks for being my friends from elementary till now, you are truly friends. You are being my best part in my life, the beautiful moment that we spend together.
6. My best friends, Alin (who always help and stand for my egoism, hear my story and teach a lot of things), Elin (who always accompany me to everywhere), Ula (who always funny, without you, it will be boring), Adit (Who always take me up from the station or airport, and accompany me in take care my house), Heldi (my friend for laundry, komikan, cari makan siang bareng). Sorry I always make difficult for you.
7. My Accounting 2002 colleges; Budhe (Alin), Kakek (Adit), Mama (Heldi), Tante (Elin), Bule (Ula), Nenek (Titin), Mitha, Dinot, Aldi, Intan, Anom, Mba Sita, Qiqi, Ayis, Nina, Nurul, Redta, Eka, Ilsa, Dwi, Johan, Ricka, Dhisya, Arie, Fiki, Ujo, and Anung (thanks for the suggestion and help). We are the best, unique, crazy, narcissism and solid team. When will we play together again?
8. My colleges' friends Yuzal, Taufik, Manda, Ajeng, Eko, Nuri, Gepenk, Hakim, Fedy, Heri, Farhan, Aryo thank for the suggestion, advises, help and share your experience to me.
9. My ex boarding house, in the second floor that always noisy in the night and silent in the morning (always sleep late and wakeup late too, just look like kalong), Heldi, Ardha and Mitha (thanks for the room and always help me), Sri, Titin, Eka, Cha-cha (thanks for the everything), Mbak Lila (that

always be my friends when nights came), Vita and Indra (thanks for the book and data), Suri, Arbi, and also thank for my friends in the first floor, Devi, Nina, Gusti, Cici, Titin, Ega, Rena, Ike, Diana and Fajar, thanks for everything.

10. My others friends and parties that can not be mentioned in this acknowledgment, thanks for the support, pray and everything.

Jogjakarta, August 2006

ABSTRACT

Putri A., Ella (2006). *The Impact of Earnings Management on the Value-relevance of Financial Statement Information*. Yogyakarta. International Program, Faculty of Economics. Islamic University of Indonesia.

This study focused on investigating the impact of earnings management on the value-relevance of financial statement information in Indonesian companies. Discretionary accruals provide incremental information to the market. These discretionary accruals examined through short-term, long-term and total accruals. It is expected that valuation process will be change from earnings to book value in the existence of earnings management. The company that indicates earnings management expects the value-relevance of earnings is lower than the company without earnings management.

This study used the pooled Ordinary Least Squares (OLS) regression. This research found that earnings management was not affect informativeness of earnings and book value. It gave evidence that value-relevance of accounting information has no differential effect based on the use of short-term or long-term discretionary accruals as the earnings management tool.

Key words: Earnings management, Earnings, Book Value, Value-relevance and Discretionary Accruals.

ABSTRAK

Putri A., Ella (2006). *The Impact of Earnings Management on the Value-relevance of Financial Statement Information*. Yogyakarta. International Program, Fakultas ekonomi, Universitas Islam Indonesia.

Studi ini memfokuskan pada investigasi pengaruh manajemen laba pada relevansi nilai informasi laporan keuangan di perusahaan Indonesia. Discretionary accruals menyediakan informasi penting kepada pasar. Discretionary accruals ini diteliti melalui akrual jangka pendek, jangka panjang dan total. Hal ini diharapkan bahwa process penilaian akan berubah dari laba menjadi nilai buku dalam kehadiran manajemen laba. Perusahaan yang mengindikasi manajemen laba mengharapkan relevansi nilai laba lebih rendah dari pada perusahaan tanpa manajemen laba.

Studi ini menggunakan pooled Ordinary Least Squares (OLS) regression. Dalam penelitian ini ditemukan bahwa manajemen laba tidak mempengaruhi informasi laba dan nilai buku. Penelitian ini memberikan bukti bahwa relevansi nilai informasi akuntansi tidak mempunyai efek berbeda berdasarkan penggunaan discretionary accruals jangka pendek atau discretionary accruals jangka panjang sebagai alat manajemen laba.

Key words: Earnings management, Earnings, Book Value, Value-relevance and Discretionary Accruals.

CHAPTER I

INTRODUCTION

1.1. Background of The Study

One of the information sources for external parties to appraise company performance is financial statement. It is the accounting reports that communicated the financial information. The financial statements form the basis for understanding the financial position of a business company and for assessing its historical and prospective financial performance. They have capability of presenting clear presentations of a company's financial health, leading to informed business decisions.

Company performance reflected in the earnings on the income statement. Earnings are the summary measure of firm performance produced under the accrual basis of accounting. They are considered important since they are used as the summary measure of firm performance by a wide range of users. For example, earnings are used in the executive compensation, plans, in debt covenants, in the prospectuses of firms seeking to go public, and by investors and creditors.

According to Whelan and McNamara (2004), the relevance of earnings in determining the value of the firm may be influenced by the market's perception of the reliability of earnings information. Earnings management, as signaled by high levels of discretionary accruals provides an indicator of earnings reliability. Earnings management has been used for deciding the performance of the company from the past until now.

Asymmetric information between manager and investor is motivator of earnings management. Manager is trying to fix his performance by increasing income with discretionary accruals. Yet according to Dechow (1995), earnings management are using discretionary component of accruals as an indicator because it provides management with the opportunity to manipulate earnings. When the market loses the earnings reliability this may result to the less reliance on earnings in the valuation process. This condition makes the market change from the earnings into book value as the source of information in the valuation process.

DeFond and Jimbalvo (1994) examined what are called discretionary accrual, which is a noncash financial statement adjustment which “accrue” revenue (e.g., debits to accounts receivable and credits to sales) or accrue expense (e.g., debits to warranty expenses and credits to accrued warranties payable). This study suggests that management tends to make accounting changes and/or to manipulate discretionary accruals to avoid violating debt covenants. Earnings increases that arise from management’s efforts to avoid violating covenant provisions are unlikely to reflect the true underlying economic condition of the company and, are not likely to be sustainable.

Discretionary accruals provide incremental information to the market. These discretionary accruals can be examined through both short-term and long-term accruals. Short-term accruals are more value-relevant than long-term accruals (Wilson 1986; Chia et al 1997; Guay and Sidhu 2001); however, the impact of long-term accruals increases as the return interval increases (Cotter

1996; Guay and Sidhu 2001). As short-term and long-term accruals have the potential to mitigate different timing and matching problems, thus providing management with alternatives in the use of discretionary accruals.

The result of Whelan and McNamara (2004) study's provided evidence of the value-relevance of earnings and book value for Australian firms. It shows that earnings management via long-term discretionary accruals has a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals.

In Indonesia the research of earnings management are already many, but most of the research investigate the influence of earnings management in the Initial Public Offering (IPO). The research did by Saiful (2002), Tatang (2001), and Lillis (2002) has shown that there is earnings management in the company done IPO in the JEX. Gumanti (2000) and Arief (2003) have shown that two years and one year before go public the company done earnings management through income increasing discretionary accruals.

Based on the previous phenomena, the writer is interested to investigate the impact of earnings management on the value-relevance of financial statement information in Indonesian firms. This investigation will be done in Jakarta Stock Exchange as a developing market. According to the background of the study, the writer entitles this thesis as follow: **The Impact of Earnings Management on the Value-relevance of Financial Statement Information.**

1.2 Problem Identification

The basic problem that the writer would like to focus is the impact of earning management on the value-relevance of earnings and book value. Since the firms that indicate earnings management show that the value-relevance of earnings is lower than the firms without earnings management, therefore it is expected that there will be a shift from reliability of earnings to reliability of book value in the valuation process.

Discretionary accruals usually provide management with the opportunity to manipulate earnings so they are used as an indicator of earnings management. Therefore, in this research, the writer would like to examine the differential effect on value-relevance of earnings management through the use of short-term versus long-term discretionary accruals.

1.3 Problem Formulation

Based on the problem identification, the problems can be formulated as follows:

1. Does earnings management has significant impact on the value-relevance of earnings and book value of equity?
2. Does earnings management via short term and via long term discretionary accruals have the differential effect of on the value-relevance of earnings and book value of equity?

1.4 Problem Limitation

For focusing to this study, the writer made several limitations in the investigation. In this case, there has been some scope of limitation on Indonesian firms, which are:

1. The firms are listed in the Jakarta Stock Exchange (JSX) from period of 1999 to 2003.
2. The firms in the financial, insurance, and banking industries were excluded due to industry specific regulations that may influence accrual choices.
3. This study is concentrated on financial statement information especially on the earnings and book value of firms in JSX.

1.5 Research Objectives

This research refers to a model which is stated by Whelan and McNamara (2004), but this research is done in Indonesia and used Indonesian firms as a research area. Based on the problem formulation above, this research is conducted to analyze the impact of earnings management on the value-relevance of earnings and book value in the Indonesian firms.

1.6 Research Contributions

This research is expected to give many contributions to:

1. Investor

The research will give a contribution especially in making decision and providing beneficial information in the conduct trades.

2. The companies

The research will give contribution to the company by giving inputs or supporting opinions and also as a consideration for making decisions in the future.

3. Academics

The research could give some contributions for conducting further researches especially about earning management and value-relevance of financial statement information.

1.7 Definition of Terms

Key word: earnings management, discretionary accruals, and value-relevance. The writer will elaborate more about these terms.

Earnings management is earnings that occur when managers use judgment in financial reporting and in structuring transactions to alter financial reports to either mislead some stockholders about the underlying economic performance of the company or to influence contractual outcomes that depend on reported accounting numbers (Healy and Wahlen, 1999).

Discretionary accruals are a measure of earnings management, which developed into short-term and long-term accruals.

Value-relevance in this research can be described as the market's valuation of earnings management to the impact of earnings and book value of equity through discretionary accruals.

CHAPTER II

REVIEW OF RELATED LITERATURE

2.1 Financial Statement

Financial accounting is the field of accounting that provides economic and financial information for investors, creditors, and other external users. That financial information is communicated through accounting reports, the most common of which are called financial statements. According to Kieso and Weygandt, there are four financial statements being prepared from the summarized accounting data. They are:

1. An income statement that presents the revenues and expenses and resulting net income or net loss for a specific period of time.
2. An owner's equity statement that summarizes the changes in owner's equity for a specific period of time.
3. A balance sheet that reports the assets, liabilities, and owner's equity at a specific date.
4. A statement of cash flows that summarizes information about the cash inflows (receipts) and outflows (payments) for a specific period of time.

Each statement provides management, owners, and other interested parties with relevant financial data. Also every set of financial statements is accompanied by explanatory notes and supporting schedules that are an integral part of the statements.

2.2 Earnings

Over the past 25 years, researchers have investigated the value-relevance of financial accounting information (Lev and Ohlson, 1982). Many of these studies seek to further our understanding of the relation between stock prices and companies' earnings.

Earning (income) is:

1. Earning is the same as net income or net profit after tax.
 2. The income that is received by a person or individual, such as compensation and passive income (interest and dividend).
- (Syahrul, Nizar, Ardiyas, 2000).

In the practice of business world, it is often meet the difference of earnings according to the accounting concept and earnings according to the economy concept. According to Ahmed Belkaoui, the definition of earnings according to the accounting concept is the difference between revenue from transaction in a certain period subtracted by expense in the same period. The definition of earnings according to the economy concept is defined by Adam Smith as an increase in wealth.

Earnings are the results of profitable operations. According to Zahroh (2000) earnings are the change in equity (net assets) of an equity during given period that are resulted from transactions and other events and circumstances from non owner sources except the effects of certain accounting adjustments of earlier period and certain other changes in net assets.

Earning is net income that is earned by a company in a specific fiscal year.

It is one of the information sources that can be taken from the financial statement that have a high role in corporate valuation. It believes that current accounting earnings are more useful than measures of current cash flow in predicting future cash flow. It also can be used to contract and re-contract as well as to evaluate and reward management.

The FASB states that earnings and its components being measured by accrual accounting generally provides a better indication of enterprise performance than current cash and payments. The FASB contends that the users pay attention to a firm's accounting earnings because these are measures of periodic firm performance and improve their ability to forecast companies' future cash flow. If accounting earnings are viewed by investors as an important piece of information for assessing firm value, then earnings differences across firms should help explain differences in these firms' stock prices. This is just another way of saying that earnings are value-relevant.

2.3 Book Value of Equity

Equity valuation models are widely used to value the firm. These models use different approaches to show the relation between accounting data and value of the firm. It is called value relevant. An alternative role of book value of equity in pricing models is that it is an economically meaningful value-relevant factor in its own right. It appears to be two distinct views in this literature on the nature or source of book value of equity's value relevance.

Consistent with viewing the firm as a going concern, Ohlson (1995) and Penman (1992) argue that book value act as a proxy for expected future normal earnings. Alternatively, Burgstahler and Dichev (1997), Berger et al (1996) and Barth et al (1996) argue that the value relevance of book value stems from its role as a proxy for adaptation or abandonment value. Omission of book value of equity in the model, either in its possible role as a control for scale differences or as a value-relevant attribute, will induce a negative bias in the coefficient on earnings if book value is positively correlated with stock price but negatively correlated with earnings for loss firms.

2.4 The Relationship of Value-Relevance of the Earnings and Book Value

In Collins, Daniel W, Maydew, Edward L, Weiss, and Ira S (1997) research investigates systematic changes in the value-relevance of earnings and book values over time. Three preliminary findings are reported. First, contrary to claims in the professional literature, the combined value-relevance of earnings and book values has not declined over the past 40 years and, in fact, appears to have increased slightly. Second, while the incremental value-relevance of "bottom line" earnings has declined, it has been replaced by increasing value-relevance of book values. Finally, much of the shift in value-relevance from earnings to book values can be explained by the increasing frequency and magnitude of one-time items, the increasing frequency of negative earnings, and changes in average firm size and intangible intensity across time.

from the change in the economic condition of the firm and the level of property, plant, and equipment. The Jones model (Jones, 1991) is used as a basis for developing two distinct models to estimate short-term and long-term discretionary accruals. For comparative purposes, the Jones model can be used to estimate total discretionary accruals. Industry-based cross-sectional Jones model is developed to estimate expected accruals for a firm. While the modified-Jones model is more applicable for firms that are ex-ante likely to manage earnings (Thomas and Zhang, 2000), so it has been rejected for this study.

2.6 Earnings Management

The policies and procedures used by an entity to determine income define earnings measurement. If management systematically select accounting principles that favorably report earnings, they are engaging in earnings management. Managers make many choices that affect income. They make business decisions with the objective of adding economic value to the firm. Management elects to report those business activities through its accounting decisions.

The relationship between business and accounting decisions results in reported income. Management's business decisions capture the essence of what must be measured, and their accounting choices reflect how they are reported. Because of that to improve the company's benefit, management use earnings management to prepare financial statement in an attempt to affect accounting information, especially earnings.

Earnings management occur when managers use judgment in financial reporting and in structuring transactions to alter financial reports to either mislead some stockholders about the underlying economic performance of the company or to influence contractual outcomes that depend on reported accounting numbers (Healy and Wahlen, 1999). Earnings management occurs for a variety of reasons, including to influence stock Market perceptions, to increase management's compensation, to reduce the likelihood of violating lending agreements, and to avoid regulatory intervention.

Earnings management happens when managers use their discretionary power in the financial reporting process and in structuring transactions. By smoothing earnings over time, managers convey private information to stakeholders about the underlying economic performance of the company or attempt to influence contractual outcomes that depend on the reported accounting numbers. This can arise if managers have access to information that is not available to outside stakeholders so that earnings management is unlikely to be transparent to outsiders.

Burgstahler and Dichev's (1997) state that strongest result in support of earnings management is that cash flows increase for the small profit group relative to the small loss group. If earnings management is used to avoid reporting a loss, then firms that report small profits have higher discretionary accruals than small loss firms. By managing up the earnings, firms move from reporting a small loss to a small profit.

2.7 Previous Research

The value-relevance of earnings has been examined by many researchers. Beaver and Dukes (1972); Wilson (1986); Dechow (1994) have shown that in predicting stock returns earnings has more superiority than cash flows. Earnings, Adaptation and Equity Value wrote by David C. Burgstahler and Illia D. Dichev (1997) developed an option-style valuation model; that main prediction is that the equity value is a convex function of both earnings and book value, where the function depends on the relative values of earnings and book value.

Book value is considered to be value-relevant when a firm's book value proxies for expected future normal earnings, assuming the firm are a going concern (Penman 1992; Ohlson 1995). Book value may become a proxy for the liquidation value of the firm when the firm is not a going concern (Burgstahler and Dichev 1997; Barth et al 1998). Evidence indicates that book value plays a role in valuation for firms with losses when the losses are transitory. In this case, the role of book value may either be as a proxy for the abandonment option (Berger et al 1996) or for the expected future normal earnings (Collins et al 1999).

Berger et al 1996; Burgstahler and Dichev 1997; Collins et al 1997; Barth et al 1998 study's focused on the reliability of earnings when assessing the relative value-relevance of earnings and book value. However, if the reliability of one measure is low, other measures will become more value-relevant

Earnings reliability becomes questionable when motivation exists for the manipulation of earnings (Brown 1999; Healy and Wahlen 1999; Dechow and Skinner 2000; Rosenfield 2000; Duncan 2001). When a firm engages in earnings

management, the earnings figure may no longer be a true and fair reflection of firm performance thus reducing the reliability of earnings. As the earnings measure becomes less reliable, the market may look to book value as an alternate measure of value, thus leading to an increase in the value-relevance of book value.

Management may find difficult to conceal the manipulation of short-term accruals as the market expects all accruals to reverse within one accounting period. As long-term accruals tend to reverse further into the future, they provide management with the opportunity to conceal their manipulations for longer. Consequently, there is a need to investigate total discretionary accruals and its short-term and long-term components to better evaluate the impact of earnings management on the value-relevance of financial statement information.

Richardson et al (2001) examined the information content of accruals with respect to earnings quality and find that long-term accruals provide more information about future SEC enforcements than short-term accruals. The use of long-term accruals to manipulate financial statements has also been revealed in recent corporate collapses.

The research of Whelan and McNamara (2004) provided a link between valuation and earnings management research. This study's provided evidence of the value-relevance of earnings and book value for Australian firms. It showed that earnings management via long-term discretionary accruals has a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals.

2.8 Hypothesis Formulation

2.8.1 Values of Earnings and Book Value

Equity value is a convex function of both earnings and book value, where the function depends on the relative values of earnings and book value (Burgstahler and Dichev, 1997). Since the earnings management is used in the financial statement, the value of earnings is becoming decline. The declining reliance in the earnings may result less reliance in the valuation process for the stakeholders. When the value of earnings is declining so the stock price is also declining.

Then the market will shift to book value as the valuation process. It means that the book value will increase and the stock price will increase too. The research establishing the value-relevance of earnings and book value has predominantly used US and Australian data. The use of Indonesian data in this study provides an opportunity to investigate the generalizability of past results to another market. It is expected that both earnings and book value are value-relevant as indicated by a positive association with the stock price.

H₁: earnings and book value are value-relevant

2.8.2 The Impact of Earnings Management on the Value-relevance of Financial Statement Information

When earnings management is detected in the financial statement information, the reliability of earnings is become questionable. The earnings figure may no longer be a true and fair reflection of firm performance. It may

result in a decline in the value-relevance of earnings. As the earnings measure becomes less reliable, the market may look to book value as an alternate measure of value, thus leading to an increase in the value-relevance of book value.

The fact that all accruals reverse may influence the way in which management may manipulate accruals. Management may find difficult to conceal the manipulation of short-term accruals as the market expects all accruals to reverse within one accounting period. As long-term accruals tend to reverse further into the future, they provide management with the opportunity to conceal their manipulations for longer. There is a need to investigate total discretionary accruals and its short-term and long-term components to better evaluate the impact of earnings management on the value-relevance of financial statement information.

H2: The value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via short-term discretionary accruals

H3: The value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via long-term discretionary accruals

H4: The value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via discretionary accruals

2.8.3 The Impact of Long-Term and Short-Term Discretionary Accruals

The market may perceive the use of long-term discretionary accruals as an earnings management tool differently from the use of short-term discretionary accruals. Long-term discretionary accruals provide management with the opportunity to conceal accrual manipulations for longer; the market may perceive the use of such accruals to be indicative of management attempting to fool the market. On the other hand, the use of short-term discretionary accruals may be viewed merely as management sending a signal to the market. As a result, long-term accruals may reduce the perception of earnings reliability more so than the use of short-term discretionary accruals as they suggest greater likelihood of manipulation. The impact on the value-relevance of earnings and book value will be greater when long-term discretionary accruals are used to manage earnings than for short-term discretionary accruals.

H5: Earnings management via long-term discretionary accruals has a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals.

CHAPTER III

RESEARCH METHOD

3.1 Population and Sample Determination

Population is a group of comprehensive elements that usually in the form of people, object, transaction or event where we are interest to learn or to become the research object (Kuncoro, 2000). The population used in this research is listed company in JSX within 5 periods from 1999 until 2003. The method used in this research is purposive sampling. Purposive sampling method is a technique to collect the sample based on certain criteria that is in accordance with the purpose of research (Kuncoro, 2003).

Sample is a partial of population that becomes the object of the research. The samples which will be taken for this research are the company listed in Jakarta Stock Exchange (JSX). Numbers of firms that are included for the sample can be found 150. However, industries may react differently to certain conditions. Therefore, there are several criteria that should be fulfilling the requirement as the sample of the research, as follows:

1. Only listed companies on the Jakarta stock Exchange would be studied.
2. Firms will be included as the samples are firms that have been listed in 1999 in Jakarta Stock Exchange (JSX) and keep continuously listed until 2003.
3. Firms in the financial, banking and insurance industries were excluded from the sample.
4. The company that has cased with missing data and negative value is deleted from the sample.

3.2 Source of Data

In this research, there are stock price and financial statement data that will be used. The data is derived from Indonesian capital market directory and Jakarta stock exchange.

3.3 Operational Definition and Proxy of Variables

The researcher defines the dependent and independent variables that will be used in the regression analysis. The dependent variable is earnings management and the independent variables are stock price, earnings, book value, and discretionary accruals. There is dummy variable to determine the earnings management. The detailed description of dependent and independent variables are described below.

3.3.1 The Dependent Variable

This study use earnings management as dependent variables. The researcher uses dummy by giving value 1 and 0 on the data which is:

Earnings Management = 1

No Earnings Management = 0

The absolute value of the discretionary accruals is used to rank firms according to the usage of accruals level. High discretionary accruals are more reflect opportunistic behavior than conservative use of discretionary accruals and thus signal low reliability of earnings. So, high discretionary accruals are used as the indicator of earnings management.

There will be two groups representing earnings management and no earnings management. The top quartile is assigned to the “Earnings Management” group and the bottom quartile to the “No Earnings Management” group. The allocation is made

using each of short-term discretionary accruals, long-term discretionary accruals, and total discretionary accruals (Whelan and McNamara, 2004).

3.3.2 The Independent Variables

3.3.2.1 Stock Price

Stock price used in the regression is the price per share at the end of March, 3 months after the 31st balance date. This approach is used in order to ensure that the stock price fully reflects the information presented the requirement of Bapepam 120 days of financial balance sheet date in the annual reports (Hayn 1995; Cheng et al 1996; Ou and Sepe 2002).

3.3.2.2 Earnings

It is common practice in the valuation literature to define earnings as earnings before extraordinary items per share (Dechow 1994; Hayn 1995; Cheng et al 1996; Subramanyam 1996; Barth et al 1998; Barth et al 2001; Ou and Sepe 2002).

3.3.2.3 Book Value

Consistent with past research, book value is defined as book value of equity per share (Barth et al 1998; Ou and Sepe 2002). The number of shares outstanding as at 31 December is used as the deflator.

3.3.2.4 Discretionary Accruals

Total accruals are determined directly as the difference between earnings before extraordinary items and cash flow from operations.

$$ACC_{j,t} = EARN_{j,t} - CFO_{j,t} \quad [3.1]$$

Where

$ACC_{j,t}$ = Total Accruals for firm j in year t

$EARN_{j,t}$ = Earnings before extraordinary Items for firm j in year t

$CFO_{j,t}$ = Cash Flows from Operations for firm j in year t

This method results in less measurement error than the balance sheet approach for estimating accruals (Hribar and Collins 2002), due to certain non-operating items that impact on the current accounts without flowing through the income statement. Such items include reclassifications, acquisitions, divestitures, and foreign currency transactions (Hribar and Collins 2002). Consequently, as many of these items also include long-term accruals, the value-relevance of long-term accruals is underestimated when the indirect method is used to determine cash flows (Guay and Sidhu 2001).

Previous studies of the value-relevance of accrual components have provided the following definition of short-term accruals (Dechow 1994; Loftus and Sin 1997; Pfeiffer and Elgers 1999; Guay and Sidhu 2001).

$$STACC_{j,t} = \Delta AR_{j,t} + \Delta INV_{j,t} + \Delta OCA_{j,t} - \Delta AP_{j,t} - \Delta TXP_{j,t} - \Delta OCL_{j,t} \quad [3.2]$$

Where

$STACC_{j,t}$ = Short-term Accruals for firm j in year t

$\Delta AR_{j,t}$ = Accounts Receivable at end year t less Accounts Receivable at end year t-1 for firm j

$\Delta INV_{j,t}$ = Inventory at end year t less Inventory at end year t-1 for firm j

$\Delta OCA_{j,t}$ = Other Current Assets at end year t less Other Current Assets at end year t-1 for firm j

$\Delta AP_{j,t}$ = Accounts Payable at end year t less Accounts Payable at end year t-1 for firm j

$\Delta TXP_{j,t}$ = Tax Payable at end year t less Tax Payable at end year t-1 for firm j

$\Delta OCL_{j,t}$ = Other Current Liabilities at end year t less Other Current Liabilities at end year t-1 for firm j

As total accruals are the sum of the short-term and long-term components, long-term accruals can be determined by the difference between total accruals and short-term accruals (Teoh et al 1998).

$$LTACC_{j,t} = ACC_{j,t} - STACC_{j,t} \quad [3.3]$$

Where

- $LTACC_{j,t}$ = Long-term Accruals for firm j in year t
- $ACC_{j,t}$ = Total Accruals for firm j in year t (calculated using equation [3.1])
- $STACC_{j,t}$ = Short-term Accruals for firm j in year t (calculated using equation [3.2])

The literature proposes a number of models to estimate a firm's discretionary accruals. A limitation of the existing models for estimating discretionary accruals is that these models do not effectively partition out the short-term and long-term components. Some models appear to focus on the short-term through examination of working capital accruals (Jones 1991; DeFond and Jimbalvo 1994; Dechow et al 1995). However, long-term discretionary accruals have generally been disregarded. This study uses the Jones model (Jones 1991) as a basis for developing two distinct models to estimate short-term and long-term discretionary accruals.

For comparative purposes, the Jones model (Jones 1991) is used to estimate total discretionary accruals. The modified-Jones model has been rejected for this study as it is more applicable for firms that are ex-ante likely to manage earnings (Thomas and Zhang 2000). An estimate of expected accruals for a firm is developed using an industry-based cross-sectional Jones model.

$$\frac{ACC_{j,t}}{TA_{j,t-1}} = \varphi_1 \left(\frac{1}{TA_{j,t-1}} \right) + \varphi_2 \left(\frac{\Delta REV_{j,t}}{TA_{j,t-1}} \right) + \varphi_3 \left(\frac{PPE_{j,t}}{TA_{j,t-1}} \right) + \varepsilon_{j,t} \quad [3.4]$$

Where

- $ACC_{j,t}$ = accruals for firm j in year t (calculated using equation [3.1])
- $TA_{j,t-1}$ = total assets for firm j at end year t-1
- $\Delta REV_{j,t}$ = revenues in year t less revenues in year t-1 for firm j
- $PPE_{j,t}$ = property, plant and equipment for firm j at end year t
- $\varepsilon_{j,t}$ = error term for firm j in year t

The estimated coefficients from Equation [3.4] are used to calculate the expected accruals for each firm. As the forecast is assumed to represent non-discretionary component of accruals, the difference between this estimation and actual accruals is deemed to be the total discretionary accruals.

$$DACC_{j,t} = \frac{ACC_{j,t}}{TA_{j,t-1}} - \left[j_1 \left(\frac{1}{TA_{j,t-1}} \right) + j_2 \left(\frac{\Delta REV_{j,t}}{TA_{j,t-1}} \right) + j_3 \left(\frac{PPE_{j,t}}{TA_{j,t-1}} \right) \right] \quad [3.5]$$

Where

- $DACC_{j,t}$ = discretionary accruals for firm j in year t
- $ACC_{j,t}$ = accruals for firm j in year t (calculated using Equation [3.1])
- $TA_{j,t-1}$ = total assets for firm j at end year $t-1$
- $\Delta REV_{j,t}$ = revenues in year t less revenues in year $t-1$ for firm j
- $PPE_{j,t}$ = property, plant and equipment for firm j at end year t
- j_1, j_2, j_3 = industry specific estimated coefficients from Equation [3.4]

An estimate of expected short-term accruals for a firm is developed using the revenue component of the Jones model (Jones 1991).

$$\frac{STACC_{j,t}}{TA_{j,t-1}} = \gamma_1 \left(\frac{1}{TA_{j,t-1}} \right) + \gamma_2 \left(\frac{\Delta REV_{j,t}}{TA_{j,t-1}} \right) + \varepsilon_{j,t} \quad [3.6]$$

Where

- $STACC_{j,t}$ = short-term accruals for firm j in year t (calculated using equation [3.2])
- $TA_{j,t-1}$ = total assets for firm j at end year $t-1$
- $\Delta REV_{j,t}$ = revenues in year t less revenues in year $t-1$ for firm j
- $\varepsilon_{j,t}$ = error term for firm j in year t

The cross-sectional regression equation is estimated for each industry sector. The estimated coefficients from [3.6] are then used to calculate the expected short-term accruals for each firm. As the forecast is assumed to represent non-discretionary component of short-term accruals, the difference between this estimation and actual short-term accruals is deemed to be the discretionary component of short-term accruals.

$$STDACC_{j,t} = \frac{STACC_{j,t}}{TA_{j,t-1}} - \left[g_1 \left(\frac{1}{TA_{j,t-1}} \right) + g_2 \left(\frac{\Delta REV_{j,t}}{TA_{j,t-1}} \right) \right] \quad [3.7]$$

Where

- $STDACC_{j,t}$ = short-term discretionary accruals for firm j in year t
- $STACC_{j,t}$ = short-term accruals for firm j in year t (calculated using equation [3.2])
- $TA_{j,t-1}$ = total assets for firm j at end year $t-1$
- $\Delta REV_{j,t}$ = revenues in year t less revenues in year $t-1$ for firm j
- g_1, g_2 = industry specific estimated coefficients from [3.6]

An estimate of expected long-term accruals for a firm is developed using the key drivers of long-term accruals. The relevant variables include property, plant and equipment, intangibles, and non-current provisions.

$$\frac{LTACC_{j,t}}{TA_{j,t-1}} = \eta_1 \left(\frac{1}{TA_{j,t-1}} \right) + \eta_2 \left(\frac{PPE_{j,t}}{TA_{j,t-1}} \right) + \eta_3 \left(\frac{INT_{j,t}}{TA_{j,t-1}} \right) + \eta_4 \left(\frac{NCP_{j,t}}{TA_{j,t-1}} \right) + \varepsilon_{j,t} [3.8]$$

Where

- $LTACC_{j,t}$ = short-term accruals for firm j in year t (calculated using equation [3.3])
- $TA_{j,t-1}$ = total assets for firm j at end year t-1
- $PPE_{j,t}$ = property, plant and equipment for firm j at end year t
- $INT_{j,t}$ = intangibles for firm j at end year t
- $NCP_{j,t}$ = non-current provisions for firm j at end year t
- $\varepsilon_{j,t}$ = error term for firm j in year t

Property, plant and equipment and intangibles are included to capture the accruals associated with depreciation and amortization. It is assumed that these accounts are not managed thereby leading to an estimation of non-discretionary accruals. Total non-current provisions for the firm are included to capture any industry-specific long-term accruals such as warranty provisions and provisions for mine maintenance as well as employee entitlements.

The cross-sectional regression equation is estimated for each industry sector. The estimated coefficients from [3.8] are used to calculate the expected long-term accruals for each firm. As the forecast is assumed to represent the non-discretionary component of long-term accruals, the difference between this estimation and actual long-term accruals is deemed to be the discretionary component of long-term accruals.

$$LTDACC_{j,t} = \frac{LTACC_{j,t}}{TA_{j,t-1}} - \left[h_1 \left(\frac{1}{TA_{j,t-1}} \right) + h_2 \left(\frac{PPE_{j,t}}{TA_{j,t-1}} \right) + h_3 \left(\frac{INT_{j,t}}{TA_{j,t-1}} \right) + h_4 \left(\frac{NCP_{j,t}}{TA_{j,t-1}} \right) \right] [3.9]$$

Where

- $LTDACC_{j,t}$ = long-term discretionary accruals for firm j in year t
- $LTACC_{j,t}$ = long-term accruals for firm j in year t (calculated using equation [3.3])

| | |
|----------------------|--|
| $TA_{j,t-1}$ | = total assets for firm j at end year t-1 |
| $PPE_{j,t}$ | = property, plant and equipment at end year t for firm j |
| $INT_{j,t}$ | = intangibles at end year t for firm j |
| $NCP_{j,t}$ | = non-current provisions at end year t for firm j |
| h_1, h_2, h_3, h_4 | = industry specific estimated coefficients from [3.8] |

3.4 Analysis Model

This study uses the valuation framework developed by Ohlson (1995) to examine the value-relevance of earnings and book value of equity. An empirical adaptation of Ohlson's theoretical model has been used extensively in the value-relevance literature (Burgstahler and Dichev 1997; Collins et al 1997; Barth et al 1998; Collins et al 1999; Ou and Sepe 2002). In the empirical model, market price is a linear function of earnings and book value of equity.

$$P_{jt} = \alpha_0 + \alpha_1 E_{jt} + \alpha_2 BV_{jt} + \tau_{jt} \quad [3.10]$$

Where:

- P_{jt} = stock price for firm j at the end of the third month of year t+1
- E_{jt} = earnings before extraordinary items per share for firm j in year t
- BV_{jt} = book value of equity per share for firm j at end year t
- τ_{jt} = error term for firm j in year t

The coefficients (α_1 and α_2) represent the value-relevance of earnings and book value respectively. From Hypothesis 1, it is expected that both earnings and book value display a positive association with firm value. Thus, both α_1 and α_2 are expected to be significantly positive.

Ohlson's model is extended to capture the impact of earnings management through the inclusion of slope dummies for earnings and book value. Each dummy variable has a value of one when the level of discretionary accruals indicates earnings management. The earnings management indicator is established using short-term discretionary accruals, long-term discretionary accruals, and total discretionary

accruals. An intercept dummy is also included in the model to assess the value-relevance of earnings management in its own right.

$$P_{jt} = \beta_0 + \beta_1 D_{jt} + \beta_2 E_{jt} + \beta_3 E_{jt}D_{jt} + \beta_4 BV_{jt} + \beta_5 BV_{jt}D_{jt} + \omega_{jt} \quad [3.11]$$

Where

$D_{jt} = 1$ if Earnings Management; 0 otherwise

The β_2 slope coefficient represents the value-relevance of earnings in the absence of earnings management. The market's total response to earnings when earnings are managed is represented by the sum of the coefficients β_2 and β_3 . Likewise, the β_4 slope coefficient represents the value-relevance of book value in the absence of earnings management. The market's total response to book value when the earnings are managed is represented by the sum of the coefficients β_4 and β_5 . The slope coefficients β_3 and β_5 represent the impact of earnings management on the value-relevance of earnings and book value respectively.

From Hypotheses 2, 3, and 4, it is expected that β_3 is negative, indicating a decline in the value-relevance of earnings. Conversely, it is expected that β_5 is positive, indicating an increase in the value-relevance of book value as the market shifts its reliance away from earnings.

Assessment of the relative impact of earnings management via short-term discretionary accruals versus earnings management via long-term discretionary accruals is achieved through the inclusion of separate dummy variables for each source of earnings management. Intercept dummy variables are included in the model to represent earnings management via short-term discretionary accruals and earnings management via long-term discretionary accruals in order to assess the value-relevance of these sources of earnings management.

$$P_{jt} = \phi_0 + \phi_1 S_{jt} + \phi_2 L_{jt} + \phi_3 E_{jt} + \phi_4 E_{jt}S_{jt} + \phi_5 E_{jt}L_{jt} + \phi_6 BV_{jt} + \phi_7 BV_{jt}S_{jt} + \phi_8 BV_{jt}L_{jt} + \xi_{jt} \quad [3.12]$$

Where

$S_{jt} = 1$ if Earnings Management via short-term discretionary accruals; 0 otherwise

$L_{jt} = 1$ if Earnings Management via long-term discretionary accruals; 0 otherwise

The ϕ_3 slope coefficient represents the value-relevance of earnings in the absence of earnings management. The impact on earnings of earnings management via short-term discretionary accruals and long-term discretionary accruals is represented by ϕ_4 and ϕ_5 respectively. Similarly, the ϕ_6 slope coefficient represents the value-relevance of book value in the absence of earnings management. The impact on book value of earnings management via short-term discretionary accruals and long-term discretionary accruals is represented by ϕ_7 and ϕ_8 respectively.

If long-term discretionary accruals are expected to have more of an impact than short-term discretionary accruals, as stated in Hypothesis 5, ϕ_5 is expected to be less than ϕ_4 . Similarly, ϕ_7 and ϕ_8 are expected to be positive. Therefore, if long-term discretionary accruals are expected to have more of an impact than short-term discretionary accruals, ϕ_8 is expected to be greater than ϕ_7 .

To test the hypothesis, the analysis models are designed as follows:

- By using pooled Ordinary Least Squares (OLS) regression to estimate the three equations.
- By using the White's heteroscedasticity-consistent standard errors in testing the significance of the coefficients to control for possible heteroscedasticity in the residuals.

3.5 Formulated Hypothesis and Hypothesis Testing

3.5.1 Formulated Hypothesis

Based on the problem statements and the review of the related literature, the alternative hypothesis and the null hypothesis that are proposed in this research are:

1. H₀₁: Earnings and book value are not value-relevant
H_{A1}: Earnings and book value are value-relevant
2. H₀₂: The value-relevance of earnings is not reduced and the value-relevance of book value is not increased when firms manage earnings via short-term discretionary accruals
H_{A2}: The value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via short-term discretionary accruals
3. H₀₃: The value-relevance of earnings is not reduced and the value-relevance of book value is not increased when firms manage earnings via long-term discretionary accruals
H_{A3}: The value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via long-term discretionary accruals
4. H₀₄: The value-relevance of earnings is not reduced and the value-relevance of book value is not increased when firms manage earnings via discretionary accruals
H_{A4}: The value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via discretionary accruals
5. H₀₅: Earnings management via long-term discretionary accruals has no a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals

H_{A5}: Earnings management via long-term discretionary accruals has a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals

The null statement hypotheses and alternative statement hypotheses above can be stated in terms of mathematical sign or statistics by the following table 3.1

TABLE 3.1 MATHEMATICAL SIGNS OF HYPOTHESIS

| | | |
|-----------------------|-------------------------------------|-------------------------------|
| H_0_1 | $\alpha_1, \alpha_2 \leq 0$ | Refer to the equation of 3.10 |
| H_0_1 | $\alpha_1, \alpha_2 > 0$ | |
| H_0_2, H_0_3, H_0_4 | $\beta_3 \geq 0 ; \beta_5 \leq 0$ | Refer to the equation of 3.11 |
| H_0_2, H_0_3, H_0_4 | $\beta_3 < 0 ; \beta_5 > 0$ | |
| H_0_5 | $\phi_4 = \phi_5 ; \phi_7 = \phi_8$ | Refer to the equation of 3.12 |
| H_0_5 | $\phi_4 > \phi_5 ; \phi_7 < \phi_8$ | |

3.5.2 Hypothesis Testing

The alternative hypotheses are tested by using the pooled Ordinary Least Squares (OLS) regression in order to find the relationship between the dependent and independent variables that are used in this research. The estimated coefficients are used to test Hypothesis 1, 2, 3, and 4. A Wald test is used to test Hypothesis 5.

After finding the regression results, the hypothesis testing was done by analyzing the significance of coefficient and variable. Determine the t-statistics for each hypothesis which can be calculated using SPSS12.0. The t-test is used for recognizing whether there are significantly impacts of independent variables on the dependent variables. The t-test is held, by comparing the t-count value with the t-table value. If the t-counts value of the regression result is higher than that of t-table value, the alternative is accepted.

There are two ways to overcome the bias in the t-statistics due to a lack of independence of the observations because of the pooling of firm observations. The

results are reported on an annual basis as well as for the pooled data. Furthermore, to control for possible heteroscedasticity in the residuals, the significance of the coefficients is tested using White's heteroscedasticity-consistent standard errors. Because the result have been giving significant t- test value. The researcher uses the level of confidence 95% ($\alpha = 5\%$). In order to accept the alternative hypothesis, the significant value of each test has been below 0.05.

The arguments of rejecting null hypothesis are:

1. H_0_1 is rejected when the α_1 (earnings) and α_2 (book value) has positive sign, and its probability of t-test is the significant level is lower than α (0.05).
2. H_0_2 , H_0_3 , H_0_4 are rejected when the β_3 has negative sign and β_5 has positive sign, and its probability of t-test is the significant level is lower than α (0.05).
3. H_0_5 is rejected when the $\phi_4 > \phi_5$ and $\phi_7 < \phi_8$, and its probability of t-test is the significant level is lower than α (0.05).

3.6 Classical Assumption Test

3.6.1 Heteroscedasticity Test

The condition of heterocedasticity occurs when the dispersion of individual errors around the population regression function changes for every observation. The existence of heteroscedasticity causes the regression coefficient estimation become inefficient. Regression model is considered good if there is no heterocedasticity. The significance of the coefficients is tested using White's heteroscedasticity-consistent standard errors to control heteroscedasticity in the residuals. It can be concluded that if heterocedasticity does not exist, it will prove that the data was valid and free from the bias.

3.6.2. Autocorrelation Test

Autocorrelation means “correlation between members of series of observations ordered in time series (as in time series) or space (as in cross- sectional data)”. This test uses Lagrange Multiplier (LM) method to find out if there is any autocorrelation or partial correlation in the model being tested. The procedures are:

- a) Set the null and alternative hypothesis

H_0 : There is no autocorrelation

H_1 : There is autocorrelation

- b) Set the level of significant which is 5%

- c) Count the LM Method

- d) Test the result

There is no autocorrelation if probability of chi squares $> \alpha$ (0.05)

There is autocorrelation if probability of chi squares $< \alpha$ (0.05)

3.6.3. Outlier Test

Outlier is the extreme data that influence the estimated model or influence the coefficient. Outlier test in this research is done by using cook's distance value of 2.5. If the results of cook's distance value is lower than 2.5, the data is free from bias; if it is not, the data is bias.

CHAPTER IV

RESEARCH FINDINGS, DISCUSSION, AND IMPLICATIONS

This chapter explains about the beginning process of gathering the data, measurement of variables used in this research, data analysis and interpretation of hypothesis testing. This chapter consists of research preparation, research process, research findings and discussion, and research implications.

4.1 Research Preparation

Data needed in this research are obtained from Indonesian Capital Market Directory (ICMD) 1999-2003 and Capital Market Data Base of JSX corner FE UII with data criterion:

- a. The companies which are selected in this research are obtained 795 companies from year 1999-2003. Those companies are already sorted and fulfill the requirements as sample in this research with the completeness data based on research variable. Companies and its stock codes that are used in this research are stated in the appendices 1.
- b. The data needed in this research are obtained from financial statements, the data include: account receivables, inventories, other current assets, account payables, tax payable, other current liabilities, total assets, property, plant and equipment, intangibles, and non-current provisions. While cash flows from operations can be found in the statement of cash flows. Other data needed are stock price at the

end of the third month of year t+1, earnings before extraordinary items per share, book value of equity per share, earnings before extraordinary items and revenue can be easily derived from the financial statement summary that are included in the Indonesian Capital Market Directory (ICMD).

- c. The amounts of the companies that can fulfill the requirements are not the same from one to another hypothesis. For hypothesis 1 there are 795 companies that fulfill the requirements. To test hypothesis 2, 3, 4 and 5 are using earnings management dummy variable. The establishment of earnings management indicator are using quartiles by exclude the middle two quartiles from the sample. For hypothesis 2 the earnings management dummy variable was generated by short-term discretionary accruals, resulting in a sample size of 398 companies. In hypothesis 3 the earnings management dummy variable was generated by long-term discretionary accruals, resulting in a sample size of 398 companies. For hypothesis 4 the earnings management dummy variable was generated total discretionary accruals, resulting in a sample size of 398 companies. For hypothesis 5 the earnings management dummy variable was generated by short-term and long-term discretionary accruals, resulting in a sample size of 200 companies.

4.2 Research Process

Data used in this research are obtained from Indonesian Capital Market Directory (ICMD) 1999-2003 and Capital Market Data Base of JSX corner FE UII. The companies that become the object of this research are 159 companies that are consistently listed in JSX for period 1999-2003 they are selected based on the requirement of fulfillment for this research.

The hypothesis testing is done by statistical testing method. After all variables needed were computed using Excel, the researcher used SPSS and E-VIEWS for processing data statistically.

4.3 Research Findings and Discussions

4.3.1 Descriptive Statistic

From the sample in the hypothesis 5 we can divide the sample into four categories; that are No earnings management, Earnings Management via Short-term and Long-term, Earnings Management via Short-term only, and Earnings Management via Long-term only. The objective of the descriptive statistics is to show differences of the variables between categories.

In detail, the sample characteristics are shown in table 4.1. Companies with earnings management show the lower stock price, earnings per share and book value per share than companies with no earnings management. The lower stock price indicates that the market may interpret the use of discretionary accruals as earnings management than as a signal to the market. Companies use earnings management to smooth earnings to put stability of the market.

Table 4.1
Descriptive Statistics

| | | N | Mean | Std. Deviation | Minimum | Maximum |
|---|----|-----|-----------|----------------|----------|----------|
| All Companies | P | 200 | 2770.8250 | 6616.07637 | 20.00 | 45300.00 |
| | E | 200 | 239.5881 | 1034.08507 | -6017.00 | 5023.00 |
| | BV | 200 | 1597.9950 | 4110.48327 | -7014.00 | 29277.00 |
| NO Earnings Management | P | 53 | 2322.6415 | 6365.82028 | 55.00 | 45000.00 |
| | E | 53 | 150.2830 | 513.36628 | -442.00 | 3543.00 |
| | BV | 53 | 1882.9434 | 4142.10521 | -241.00 | 29277.00 |
| Earnings Management Short-term and Long-term | P | 84 | 3648.0952 | 8413.38320 | 20.00 | 45300.00 |
| | E | 84 | 232.1835 | 1339.05548 | -6017.00 | 5023.00 |
| | BV | 84 | 1565.8333 | 4312.96375 | -7014.00 | 20572.00 |
| Earnings Management Short-term only | P | 34 | 2398.3824 | 3454.00069 | 35.00 | 11850.00 |
| | E | 34 | 413.9588 | 825.19893 | -479.00 | 2751.00 |
| | BV | 34 | 2599.8824 | 4560.34760 | -82.00 | 20410.00 |
| Earnings Management Long-term only | P | 29 | 1485.5172 | 2717.15658 | 65.00 | 12900.00 |
| | E | 29 | 219.8138 | 969.61086 | -2025.00 | 2618.00 |
| | BV | 29 | -4.2414 | 2129.34704 | -4914.00 | 4596.00 |

Table 4.2 show the Pearson correlation coefficient about the relationship between stock price with earnings per share, and stock price with book value per share. When there is no earnings management the correlation between stock price and earnings and book value is higher ($\text{EPS} = 0.944$ and $\text{BVPS} = 0.980$). If there is earnings management via short-term and long-term discretionary accrual, the relationship is weaker ($\text{EPS} = 0.692$ and $\text{BVPS} = 0.777$).

The correlation between stock price with earnings per share is more lower than stock price with book value per share in the presence of earnings management. That means earnings management reduces the value-relevance of earnings and increases the value relevance of book value.

Table 4.2
Pearson Correlation of Earnings with Price & Book Value with Price

| | Correlation with Price | | |
|--|------------------------|--------|-----|
| | EPS | BVPS | n |
| No Earnings Management | .944** | .980** | 53 |
| Earnings Management Short-term and Long-term | .692** | .777** | 84 |
| Earnings Management Short-term only | .736** | .747** | 34 |
| Earnings Management Long-term only | .396 | .630** | 29 |
| All Companies | .666** | .778** | 200 |

*Correlation is significant at the 0.05 level (2-tailed).

**Correlation is significant at the 0.01 level (2-tailed).

4.3.2 Hypothesis Testing

4.3.2.1 Values of Earnings and Book Value

Refer to chapter 3, it is hypothesized that earnings and book value are value-relevant. Based on table 4.3 we can see from the adjusted R-square that 46% of dependent variable (P) can be explained by independent variables (E and BV), and the rest will be explained with the variable that we don't know. That table shows the coefficient of earnings ($\alpha_1 = 1.717181$, $p = 0.0742$) and book value ($\alpha_2 = 0.801753$, $p = 0.0000$) are positive. Eventhough the p-value of earnings is significantly weak; it's failed to reject H_01 . It means that earnings and book value are not value-relevant. This result is different with the past research which is done by Whelan & McNamara (2004). This difference could be caused because the research held in different country and different periods.

Table 4.3
Result of the OLS Regression Test Equation 3.1 Hypothesis 1

| Variable | Adjusted R-squared | Coefficient | t-Statistic | Prob. |
|----------|--------------------|-------------|-------------|--------|
| E | 0.459962 | 1.717181 | 1.787705 | 0.0742 |
| BV | | 0.801753 | 4.353959 | 0.0000 |

4.3.2.2 The Impact of Earnings Management on the Value-relevance of Financial Statement Information

Refer to chapter 3, it is hypothesized that the value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via short-term discretionary accruals. Based on table 4.4 we can see from the adjusted R-square that 54.77% of dependent variable (P) can be explained by independent variables (D, E, ED, BV, BVD), and the rest will be explained with the variable that we don't know. The table shows that the insignificant coefficient of slope dummy variables ($\beta_1 = 882.1206$, $p = 0.0533$) indicates that earnings management through short-term discretionary accruals is not value-relevant.

The coefficient of earnings influenced by short-term earnings management is positive ($\beta_3 = 2.573786$, $p = 0.1360$) and the coefficient of book value influenced by short-term earnings management is negative ($\beta_5 = -0.0442411$, $p = 0.3923$) while the p-value of both coefficient $> \alpha = 0.05$ so failed to reject H_02 . This result indicates that the value-relevance of earnings is not reduced and the value-relevance of book value is not increased when firms manage earnings via short-term discretionary accruals.

**Table 4.4
Result of the OLS Regression Test Equation 3.2 Hypothesis 2**

| Variable | Adjusted R-squared | Coefficient | t-Statistic | Prob. |
|----------|--------------------|-------------|-------------|--------|
| D | 0.547655 | 882.1206 | 1.938533 | 0.0533 |
| E | | 1.760767 | 1.493833 | 0.1360 |
| ED | | 2.573786 | 0.914168 | 0.3612 |
| BV | | 0.877578 | 3.359666 | 0.0009 |
| BVD | | -0.442411 | -0.856329 | 0.3923 |

Refer to chapter 3, it is hypothesized that the value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via long-term discretionary accruals. Based on table 4.5 we can see from the adjusted R-square that 56.70% of dependent variable (P) can be explained by independent variables (D, E, ED, BV, BVD), and the rest will be explained with the variable that we don't know.

The table shows that the coefficient of earnings influenced by long-term earnings management is negative ($\beta_3 = -2.735462$, $p = 0.0619$) indicating there is a declining in the value relevance of earnings when companies manage earnings via long-term discretionary accruals. The coefficient of book value influenced by earnings management is positive ($\beta_5 = 0.510950$, $p = 0.2305$) indicating an increasing in the value-relevance of book value when company manage earnings via long-term discretionary accruals. Eventhough the coefficients are consistent with hypothesis 3 but the p-value of both coefficient $> \alpha = 0.05$ so failed to reject H_03 . Thus the value-relevance of earnings is not reduced and the value-relevance of book value is not increased when firms manage earnings via long-term discretionary accruals.

**Table 4.5
Result of the OLS Regression Test Equation 3.2 Hypothesis 3**

| Variable | Adjusted R-squared | Coefficient | t-Statistic | Prob. |
|----------|--------------------|-------------|-------------|--------|
| D | 0.567030 | 1104.845 | 2.921440 | 0.0037 |
| E | | 2.536840 | 1.841435 | 0.0663 |
| ED | | -2.735462 | -1.872288 | 0.0619 |
| BV | | 0.791505 | 2.862650 | 0.0044 |
| BVD | | 0.510950 | 1.201026 | 0.2305 |

Refer to chapter 3, it is hypothesized that the value-relevance of earnings is reduced and the value-relevance of book value is increased when firms manage earnings via discretionary accruals. Based on table 4.6 we can see from the adjusted R-square that 65.56% of dependent variable (P) can be explained by independent variables (D, E, ED, BV, BVD), and the rest will be explained with the variable that we don't know. The table shows that the insignificant coefficient of slope dummy variables ($\beta_1 = 436.5403$, $p = 0.4022$) indicates that earnings management through total discretionary accruals is not value-relevant.

The coefficient of earnings influenced by total earnings management is negative and significant ($\beta_3 = -8.517443$, $p = 0.0020$) indicating a decline in the value relevance of earnings when company manage earnings via total discretionary accruals. While the coefficient of book value influenced by total earnings management is positive but not significant ($\beta_5 = 0.568252$, $p = 0.1645$) indicating no impact on the value-relevance of book value when company manage earnings via total discretionary accruals. The result of the coefficient makes to failed to reject H_04 .

**Table 4.6
Result of the OLS Regression Test Equation 3.2 Hypothesis 4**

| Variable | Adjusted R-squared | Coefficient | t-Statistic | Prob. |
|----------|--------------------|-------------|-------------|--------|
| D | 0.655607 | 436.5403 | 0.838557 | 0.4022 |
| E | | 9.513207 | 3.641485 | 0.0003 |
| ED | | -8.517443 | -3.118004 | 0.0020 |
| BV | | 0.331842 | 1.041396 | 0.2983 |
| BVD | | 0.568252 | 1.392855 | 0.1645 |

4.3.2.3 The Impact of Long-Term and Short-Term Discretionary Accruals

Refer to chapter 3, it is hypothesized that earnings management via long-term discretionary accruals has a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals. Based on table 4.7 we can see from the adjusted R-square that 65.68% of dependent variable (P) can be explained by independent variables (S, L, E, ES, EL, BV, BVS, BVL), and the rest will be explained with the variable that we don't know.

That table shows the coefficient of earnings influenced by short-term earnings management ($\phi_4 = 0.962888$, $p = 0.5381$) is bigger than the coefficient of earnings influenced by long-term earnings management ($\phi_5 = -0.668495$, $p = 0.6794$). While the coefficient of book value influenced by short-term earnings management ($\phi_7 = -0.729595$, $p = 0.0247$) is more little than the coefficient of book value influenced by long-term earnings management ($\phi_8 = 0.603533$, $p = 0.2034$). Although the coefficients are consistent with hypothesis 5 but the p-value is not significant so failed to reject H_{05} .

Table 4.7
Result of the OLS Regression Test Equation 3.3 Hypothesis 5

| Variable | Adjusted R-squared | Coefficient | t-Statistic | Prob. |
|----------|--------------------|-------------|-------------|--------|
| S | 0.656829 | 309.8650 | 0.604255 | 0.5464 |
| L | | 1449.596 | 2.989855 | 0.0032 |
| E | | 0.856039 | 0.553028 | 0.5809 |
| ES | | 0.962888 | 0.616809 | 0.5381 |
| EL | | -0.668495 | -0.413906 | 0.6794 |
| BV | | 1.248114 | 5.200194 | 0.0000 |
| BVS | | -0.729595 | -2.263198 | 0.0247 |
| BVL | | 0.603533 | 1.276161 | 0.2034 |

To make comparison of the differences between the coefficient estimation, we can use Wald Test. Based on table 4.8 the result of the joint restriction of Wald test is significant. This means that earnings management via long-term discretionary has a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals.

**Table 4.8
Result of Wald Test**

| | | | |
|--|----------|-------------|----------|
| $H_0: \phi_4 = \phi_5$ and $\phi_7 = \phi_8$ | | | |
| $H_a: \phi_4 > \phi_5$ and $\phi_7 < \phi_8$ | | | |
| Chi-square | 16.12426 | Probability | 0.000315 |

4.3.3 Classical Assumption Test

4.3.3.1 Heteroscedasticity Test

This research used White's heteroscedasticity-consistent standard errors to control heteroscedasticity in the significance of the residuals coefficients. By using White's heteroscedasticity-consistent standard errors we made automatic correction to the heteroscedasticity which is exist in the result. Although there are several iteration in White's heteroscedasticity-consistent standard errors, the heteroscedasticity exist may be more considered and can be responsible. Therefore we make the hypothesis based on the result of White's heteroscedasticity-consistent standard errors which is shows in table 4.3 - 4.8.

4.3.3.2 Autocorrelation Test

This test were mean to find whether autocorrelation exists or not, or if there are any significant relations between residuals in regression model. This

research used LM Method. The result of LM Method in appendix 7 show that the probability of chi squares is more than α (0.05). It means that there is no autocorrelation in this data.

4.3.3.3 Outlier Test

Outlier in this research is done by using cook's distance value of 2.5. If the result is lower than 2.5, the data is free from bias. If it is not, the data is not free from the outlier. This research already eliminates the data that have cook's distance value higher than 2.5, therefore this proves that the data used in this research are valid.

4.4 Research Implication

The analysis result of hypothesis 1 shows that earnings and book value is not value-relevant. This result is different with the past research which is done by Whelan & McNamara (2004). This difference could be caused because the research held in different country and different periods.

The result of this research makes us failed to reject H_0_2 , H_0_3 and H_0_4 . Earnings management via short-term and long-term discretionary accruals has no impact on the value-relevance of earnings or book value. While earnings management via total discretionary accruals reduces the value-relevance of earnings and has no impact on the value-relevance of book value.

This result is different with the Whelan & McNamara research; they found that earnings management via total discretionary accruals has no impact on value-

relevance of earnings and book value. While earnings management via long-term and short-term reduce the value-relevance of earnings and has no impact on value-relevance of book value.

When earnings management was including on the financial statement information, the value-relevance of earnings is declining. It shows that low earnings reliability is used as an indicator of earnings management by the market. While the lack of impact on book value may reflect the market looks to the other information than book value as the base of its valuation (Whelan & McNamara, 2004).

In the hypothesis 5 shows that earnings management has no differential effect on the value-relevance of financial statement information. This is not in accordance with the hypothesis that states long-term discretionary accruals has a greater impact on the value-relevance of earnings and book value than short-term discretionary accruals. When we used Wald test, we got the different result.

Wald test was used to test the estimated coefficients to formally evaluate the differential impact of earnings management via long-term and short-term discretionary accruals. It was found that earnings management via long-term discretionary has a greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accruals. The differential impact in here indicates that the market can differentiate between long-term and short-term accruals choices.

There are a lot of possible reasons why market reacts more strongly to earnings management via long-term discretionary accruals than earnings

management via short-term discretionary accruals. One of the reasons is markets more concern to long-term discretionary accruals because it may has an impact on earnings for a long period.

Different condition make management to increase or decrease earnings. Management increase earnings in order to reach the specific goal, previous year's earnings. While management that decrease earnings has purpose to reducing the tax expense. According to the result, it shown that the market may look less favorably on the use of accruals to decrease earnings than to increase earnings. This is because the market wants to know the real financial statement information.

The analysis result on the equation can give some contribution and implication. This study gave evidence that value-relevance of accounting information has no differential effect based on the use of short-term or long-term discretionary accruals as the earnings management tool. Within that information the researcher must realize of the market reaction to the accrual choices.

For the management, when making the integrity of the financial reporting process should be more careful. The reason is because this research gives no evidence of the existence of earnings management and its impact on capital markets.

This research failed to provide the guidance in the detection of different forms of earnings management. The result showed that earnings management was not affect informativeness of earnings and book value. For the market participants, such as investors, they should be more considered in the valuation process of the company.

CHAPTER V

CONCLUSION AND RECOMMENDATION

5.1 Research Conclusion

Based on the research purpose, the statistical test and analysis that are describe in the earlier chapter, some conclusion are drawn as follows:

- a. This research gave evidence of the non value-relevant of earnings and book value in Indonesian companies. It is showed in the result of hypothesis 1. It was hypothesized in chapter 3 that earnings managements would reduce the value-relevance of earnings and would increase the value-relevance of book value. But the result of hypothesis 2 and 3 was show that earnings management didn't reduce the value-relevance of earnings and increase the value-relevance of book value. There is no impact of earnings management via short-term or long-term discretionary accruals only. While in the result of hypothesis 4 was show that earnings management reduced the value-relevance of earnings and no impact on the value-relevance of book value.
- b. Earnings Management via short-term and long-term discretionary accruals has differential effect on the value-relevance of earnings and book value. It can be seen in the result of Wald test. It showed that the earnings management via long term discretionary accruals has greater impact on the value-relevance of earnings and book value than earnings management via short-term discretionary accrual. The

differential effect indicates that the market is able to differentiate between short term and long term accruals choices.

5.2 Research Recommendation

After completion of this research the following recommendation are drawn:

- a. The period of the research for the next research can be extending to the longer period.
- b. For the next research, it is suggest adding more variable.
- c. For further research, the research should not only prove the significant impact of earnings management on the value-relevance of earnings and book value but also find what other variables that can be influenced.
- d. This research result hopefully can be used as a reference for other researcher to adequately develop or revise the research result.
