

**TUGAS AKHIR**

**ANALISIS PERUBAHAN TATA GUNA LAHAN  
TERHADAP DEBIT BANJIR  
DI DAS BENGAWAN SOLO HULU  
(*ANALYSIS OF LAND USE CHANGE  
ON FLOOD DISCHARGE  
IN BENGAWAN SOLO UPSTREAM WATERSHED*)**

Diajukan Kepada Universitas Islam Indonesia Yogyakarta Untuk Memenuhi  
Persyaratan Memperoleh Derajat Sarjana Teknik Sipil

**Yogi Sutyono  
14 511 181**

**PROGRAM STUDI TEKNIK SIPIL  
FAKULTAS TEKNIK SIPIL DAN PERENCANAAN  
UNIVERSITAS ISLAM INDONESIA  
2021**

**TUGAS AKHIR**

**ANALISIS PERUBAHAN TATA GUNA LAHAN  
TERHADAP DEBIT BANJIR  
DI DAS BENGAWAN SOLO HULU  
(ANALYSIS OF LAND USE CHANGE  
ON FLOOD DISCHARGE  
IN BENGAWAN SOLO UPSTREAM WATERSHED)**

Disusun oleh

**Yogi Sutiyono**

**14 511 181**

Telah diterima sebagai salah satu persyaratan  
untuk memperoleh derajat Sarjana Teknik Sipil

Diuji pada tanggal 08 Februari 2021

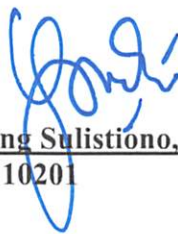

Oleh Dewan Penguji

Pembimbing

Pradipta Nandi W., S.T., M.Eng  
NIK: 135111102

Penguji I

Ir. Bambang Sulistiono, MSCE  
NIK: 805110201

Penguji II

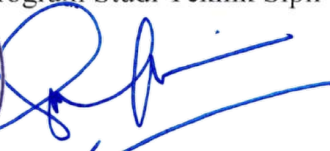

Dinia Anggraheni, S.T., M.Eng  
NIK: 165110105

Mengesahkan,

Program Studi Teknik Sipil

Sri Amint Yuni Astuti, M.T  
NIK: 885110101

## PERNYATAAN BEBAS PLAGIASI

Saya menyatakan dengan sesungguhnya bahwa laporan Tugas Akhir yang saya susun sebagai syarat untuk penyelesaian program Sarjana di Program Studi Teknik Sipil, Fakultas Teknik Sipil dan Perencanaan, Universitas Islam Indonesia merupakan hasil karya saya sendiri. Adapun bagian-bagian tertentu dalam penulisan laporan Tugas Akhir yang saya kutip dari hasil karya orang lain telah dituliskan dalam sumbernya secara jelas sesuai dengan norma, kaidah, dan etika penulisan karya ilmiah. Apabila di kemudian hari ditemukam seluruh atau sebagian laporan Tugas Akhir ini bukan hasil karya saya sendiri atau adanya plagiasi dalam bagian-bagian tertentu, saya bersedia menerima sanksi, termasuk pencabutan gelar akademik yang saya sandang sesuai dengan perundang-undangan yang berlaku.

Cirebon, 08 Februari 2021

Yang membuat pernyataan,

Yogi Sutiyono

(14 511 181)

## KATA PENGANTAR

Puji syukur penulis panjatkan kepada Allah SWT karena penulis dapat menyelesaikan Proposal Tugas Akhir yang berjudul Analisis Perubahan Tata Guna Lahan Terhadap Debit Aliran di Hulu DAS Bengawan Solo Proposal Tugas Akhir ini merupakan salah satu syarat akademik dalam menyelesaikan studi tingkat strata satu di Prodi Teknik Sipil, Fakultas Teknik Sipil dan Perencanaan, Universitas Islam Indonesia.

Dalam penyusunan laporan Proposal Tugas Akhir ini banyak hambatan yang dihadapi penulis, namun berkat kritik, saran serta dorongan semangat dari berbagai pihak, Alhamdulillah Proposal Tugas Akhir ini dapat diselesaikan. Berkaitan dengan ini, penulis ingin mengucapkan terima kasih yang sedalam-dalamnya kepada :

1. Bapak Pradipta Nandi Wardhana, S.T., M.Eng., selaku dosen pembimbing,
2. Kepala Balai Besar Wilayah Sungai Bengawan Solo, selaku pihak yang berwenang dalam memberikan izin pengambilan data terkait,
3. Bapak dan ibu serta teman-teman penulis yang telah berkorban banyak, baik material maupun spiritual, hingga selesainya Proposal Tugas Akhir ini.

Yogyakarta, 08 Februari 2021

Penulis,

Yogi Sutiyono

## ABSTRAK

Perubahan tata guna lahan yang terjadi sebagai akibat dari pertumbuhan dan perkembangan penduduk mengubah respon permukaan tanah terhadap curah hujan. Curah hujan akan menyusup ke dalam tanah jika tanah tersebut permeabel, sedangkan jika tanah bersifat impermeable maka curah hujan akan mengalir ke atas permukaan tanah.

Penelitian ini menganalisis perubahan tata guna lahan yang terjadi di sub DAS Bengawan Solo Hulu terhadap debit banjir antara tahun 2015 dan 2019. Perubahan penggunaan lahan dianalisis menggunakan data citra satelit Landsat pada software GIS. Debit limpasan dihitung menggunakan metode Nakayasu dan metode Soil Conservation Service (SCS), sedangkan debit aliran dasar menggunakan rumus dari HSS GAMA 1. Analisis perubahan tata guna lahan akan memberikan nilai curve number (CN) untuk penggunaan lahan di 2015 dan 2019.

Hasil analisis perubahan tata guna lahan memberikan nilai curve number (CN) untuk tahun 2015 dan 2019 masing-masing sebesar 78,11 dan 78,07. Penurunan yang terjadi pada nilai CN disebabkan karena bertambahnya luas lahan jenis vegetasi, penambahan luas permukiman tidak berpengaruh karena lahan sebelum dijadikan permukiman merupakan lahan pertanian yang memiliki nilai CN yang tidak banyak berbeda dengan tipe permukiman. Debit banjir yang terjadi juga mengalami penurunan antara tahun 2015 dan 2019 meskipun tidak signifikan. Penurunan debit banjir sesuai dengan penurunan nilai curve number (CN).

Kata kunci: perubahan tata guna lahan, curve number, citra landsat, Bengawan Solo Hulu

## **ABSTRACT**

*Land use changes that occur as a result of population growth and development change the response of the land surface to rainfall. The rainfall will infiltrate the soil if the soil is permeable, whereas if the soil is impermeable, the rainfall will flow above the soil surface.*

*This study analyzes land use changes that occurred in the Bengawan Solo Upstream sub-watershed against flood discharge between 2015 and 2019. Land use changes were analyzed using Landsat satellite imagery data in GIS software. The runoff discharge is calculated using the Nakayasu method and the Soil Conservation Service (SCS) method, while the base flow rate uses the formula from HSS GAMA 1. Analysis of land use change will provide a curve number (CN) value for land use in 2015 and 2019.*

*The results of the analysis land use change provides curve number (CN) values for 2015 and 2019, namely 78,11 and 78,07, respectively. The decrease that occurred in the CN value was due to the increase in land area of vegetation types, the increase in residential areas had no effect because the land before it was turned into a settlement was agricultural land which had a CN value which was not much different from the type of settlement. The flood discharge that occurred also decreased between 2015 and 2019, although it was not significant. The decrease in flood discharge corresponds to a decrease in the number curve value (CN).*

**Keywords :** *land use change, curve number, landsat image, Bengawan Solo upstream*

# BAB I PENDAHULUAN

## 1.1 Latar Belakang

Indonesia merupakan negara kepulauan terbesar di dunia yang wilayah perairannya lebih besar dari wilayah daratan. Letak Indonesia secara astronomis berada pada  $6^{\circ}$  LU -  $11^{\circ}$  LS dan  $95^{\circ}$  BT –  $141^{\circ}$  BT yang membuat wilayah Indonesia berada pada garis khatulistiwa. Secara geografis letak Indonesia berada di antara dua samudra dan dua benua. Indonesia diapit oleh dua benua yaitu Benua Asia dan Benua Australia serta berada di antara dua samudra yaitu Samudra Hindia dan Samudra Pasifik. Wilayah Indonesia yang terletak di daerah khatulistiwa menyebabkan Indonesia beriklim tropis. Pada daerah dengan iklim tropis, wilayahnya sepanjang tahun menerima sinar matahari. Berdasarkan letak Indonesia tersebut memungkinkan terjadinya penguapan air yang besar dan membuat curah hujan yang terjadi begitu tinggi. Melalui siklus hidrologi, sebagian curah hujan yang jatuh di atas tanah akan meresap ke bawah permukaan tanah (*infiltrasi*) dan meresap lebih dalam ke tanah (*perkolasi*) menjadi air tanah. Sebagian air hujan yang tidak meresap ke dalam tanah akan mengalir di atas permukaan tanah menuju sungai-sungai terdekat (Chow *et al.*, 1988).

Perkembangan pembangunan dan meningkatnya pertumbuhan penduduk yang begitu cepat mengakibatkan perubahan fungsi tata guna lahan. Banyak area yang awalnya merupakan hutan atau lahan terbuka hijau sekarang beralih fungsi menjadi daerah pemukiman maupun industri dan komersial. Lahan terbuka hijau dan hutan merupakan area yang bagus untuk resapan air hujan yang jatuh, sedangkan area industri, komersial, dan pemukiman penduduk mengakibatkan tanah menjadi kedap air. Perubahan fungsi tata guna lahan tersebut membuat air hujan yang jatuh tidak bisa meresap ke dalam tanah, sehingga air hujan lebih banyak mengalir di atas permukaan tanah dan berkurangnya air yang meresap ke dalam tanah. Akibatnya yaitu terjadi ketimpangan antara distribusi air antara

musim hujan dan musim kemarau, menyebabkan meningkatnya debit banjir dan ancaman kekeringan.

Daerah aliran sungai (DAS) Bengawan Solo merupakan salah satu daerah aliran sungai yang berada di pulau Jawa. DAS ini memiliki luas  $\pm 16.100 \text{ km}^2$  dengan panjang sungai utama  $\pm 600 \text{ km}$ , mengalir dari barat-selatan Surakarta di hulu dan berhilir di utara Surabaya. Bagian hulu dari DAS Bengawan Solo merupakan gabungan dari beberapa wilayah administratif kota/kabupaten di Jawa Tengah dan Jawa Timur diantaranya : Wonogiri, Karanganyar, Klaten, Boyolali, Sukoharjo, Surakarta, Ngawi dan Sragen.

Seiring dengan berkembangnya kegiatan perekonomian dan penambahan penduduk, maka terjadi juga perluasan area pemukiman dan perekonomian. Hal itu juga terjadi pada DAS Bengawan Solo. Menurut Badan Pusat Statistik (BPS), laju pertumbuhan penduduk di Jawa Tengah antara tahun 2010-2017 sekitar 0,78% sedangkan laju pertumbuhan di Jawa Timur antara tahun 2010-2015 sekitar 0,67 %. Pada bagian hulu DAS Bengawan Solo terjadi perubahan lahan menjadi area perkebunan yang tidak konservatif dari sebelumnya merupakan area hutan. Perubahan itu membuat air hujan sulit meresap ke dalam tanah, sehingga air hujan langsung mengalir di atas permukaan tanah. Dalam beberapa tahun terakhir terjadi peristiwa banjir akibat meluapnya sungai Bengawan Solo. Pada tanggal 19 Juni 2015 terjadi peristiwa banjir di Kota Solo yang diakibatkan oleh hujan deras sehingga ketinggian air di Pos Jurug meningkat menjadi 10,47 m dan meluap menggenangi pemukiman warga setinggi 1,5 m. Peristiwa banjir berikutnya terjadi di Bojonegoro pada tanggal 20 November 2017 akibat hujan deras di daerah hulu Bengawan Solo (Klaten dan Ngawi) membuat ketinggian air di pos pemantauan Bojonegoro mengalami peningkatan menjadi 13,26 m.

Peristiwa banjir merupakan salah satu bencana alam yang disebabkan oleh beberapa faktor, salah satunya perubahan tata guna lahan. Pada peristiwa banjir yang telah disebutkan sebelumnya perlu diketahui apakah berkaitan dengan adanya perubahan tata guna lahan atau disebabkan oleh faktor lainnya, sehingga studi mengenai perubahan tata guna lahan terhadap peristiwa banjir dapat

memberikan jawaban terkait peristiwa banjir yang terjadi di DAS Bengawan Solo Hulu.

## 1.2 Rumusan Masalah

Berdasarkan latar belakang yang telah diuraikan, rumusan masalah dari penelitian ini adalah sebagai berikut.

1. Bagaimana perubahan tata guna lahan yang terjadi di DAS Bengawan Solo Hulu dari tahun 2015 sampai tahun 2019 dengan menggunakan analisis citra satelit *Landsat*?
2. Berapa besarnya perubahan debit banjir akibat dari perubahan tata guna lahan yang terjadi di DAS Bengawan Solo Hulu dari tahun 2015 sampai tahun 2019 ?

## 1.3 Tujuan Penelitian

Berikut tujuan dari dilakukannya penelitian ini.

1. Mengetahui perubahan tata guna lahan yang terjadi di DAS Bengawan Solo Hulu antara tahun 2015 sampai tahun 2019 dengan analisis citra satelit *Landsat*.
2. Mengetahui perubahan debit banjir yang terjadi di DAS Bengawan Solo Hulu akibat dari adanya perubahan tata guna lahan antara tahun 2015 sampai tahun 2019.

## 1.4 Batasan

Penelitian ini dibatasi pada beberapa hal-hal berikut ini.

1. Penelitian dilakukan pada daerah aliran sungai (DAS) Bengawan Solo Hulu sampai ruas di hulu *junction* dengan Sungai Madiun.
2. Periode waktu analisis perubahan tata guna lahan yang ditentukan adalah dari tahun 2015 sampai tahun 2019.

### 1.5 Manfaat

Dengan dilakukannya penelitian ini diharapkan dapat memberi manfaat berupa

1. Menambah wawasan baru kepada penulis mengenai hubungan antara perubahan tata guna lahan dan debit banjir.
2. Menjadi bahan evaluasi terkait hal-hal yang berhubungan dengan perencanaan bangunan air seperti drainase, bangunan pengendali banjir dan lain-lain.

## **BAB II**

### **TINJAUAN PUSTAKA**

#### **2.1 Umum**

Tinjauan pustaka merupakan kegiatan mensurvei buku-buku, artikel ilmiah, atau sumber lain yang relevan dengan masalah tertentu, bidang penelitian, atau teori, memberikan gambaran, ringkasan, dan evaluasi sehubungan dengan masalah penelitian yang sedang terjadi dan diselidiki (Fink, 2014).

Tinjauan pustaka penting dilakukan terkait beberapa hal berikut.

1. Mengetahui hubungan studi penelitian yang dilakukan dengan penelitian terdahulu.
2. Mengidentifikasi tema, konsep dan gagasan dari sebuah penelitian.
3. Menunjukkan mengapa suatu topik penting untuk diteliti.

#### **2.2 Penelitian Terdahulu**

Topik penelitian terdahulu yang mempunyai kaitan dengan penelitian sekarang dijelaskan sebagai berikut.

##### **1. Permukiman, Komersial dan Industri**

Urbanisasi adalah perpindahan penduduk dari wilayah pedesaan ke wilayah perkotaan, biasanya untuk melakukan kegiatan ekonomi karena wilayah perkotaan dianggap memberikan peluang mendapatkan kesejahteraan yang lebih baik daripada tinggal di pedesaan. Akibat dari perpindahan penduduk, wilayah perkotaan menjadi semakin padat penduduk. Penduduk yang datang tentu membutuhkan tempat untuk tinggal dan menetap selama hidup di perkotaan. Pembangunan permukiman penduduk dan fasilitas penunjang lain tentu membutuhkan area lahan yang luas agar dapat terlaksananya pembangunan tersebut. Akibat dari adanya pembangunan, lahan yang sebelumnya merupakan lahan terbuka dan dapat ditembus oleh air hujan yang jatuh berubah menjadi area permukiman, komersial ataupun industri yang kedap air.

Nagarajan dan Basil (2014) melakukan studi kasus terhadap wilayah Kochi, India untuk mengetahui kaitan antara urbanisasi dalam hal perubahan tata guna lahan terhadap perubahan debit aliran permukaan yang terjadi selama rentang waktu tahun 2005 sampai tahun 2010. Luas wilayah Kochi sendiri sekitar 96,44 km<sup>2</sup>. Penelitian ini memakai teknik penginderaan jauh (*remote sensing*) dan Sistem Informasi Geografi (SIG) dalam mengklasifikasikan jenis-jenis lahan yang ada di area penelitian. Selama periode penelitian terlihat pola perubahan tata guna lahan dari lahan terbuka dan lahan pertanian menjadi area industri, komersial, dan permukiman padat penduduk. Data curah hujan yang digunakan adalah data curah hujan harian selama periode 1980-2010. *Soil Conservation Service Curve Number (SCS-CN)* merupakan metode perhitungan debit yang digunakan untuk mengestimasi debit aliran permukaan dalam penelitian ini. Hasil dari penelitian ini menunjukkan adanya peningkatan volume aliran permukaan dari 135,6 juta m<sup>3</sup> menjadi 141,49 juta m<sup>3</sup> dalam kurun waktu 5 tahun.

Zhu dan Li (2014) juga meneliti efek urbanisasi yang menjadi faktor perubahan tata guna lahan yang terjadi di DAS Little River, Tennessee, Amerika Serikat selama periode 1984-2010. DAS Little River memiliki luas 981 km<sup>2</sup> dan berada di ketinggian sekitar 245-2010 mdpl (meter di atas permukaan laut). Selama periode 1984-2010 terjadi perluasan area industri dan permukiman penduduk dari 5,2 % dan 1,0 % menjadi 8,3 % dan 2,8 %, sedangkan untuk lahan pertanian mengalami penyempitan dari 28,3 % menjadi 18,9 %. Model *Soil and Water Assessment Tool (SWAT)* digunakan untuk mengetahui dampak perubahan tata guna lahan terhadap efek jangka panjang siklus hidrologi. Salah satu hasil dari pemodelan *SWAT* adalah kaitan antara dampak perubahan tata guna lahan terhadap debit aliran permukaan. Dalam pemodelan *SWAT* diketahui terjadi peningkatan debit aliran sebesar 3,0 % untuk keseluruhan area DAS Little River, tetapi pada daerah hulu DAS Little River hampir tidak terjadi peningkatan debit aliran permukaan karena daerah hulu merupakan area Taman Nasional. Peningkatan terbesar terjadi pada daerah hilir yang merupakan daerah dekat perkotaan dengan peningkatan debit aliran >10,0 %, hal ini mengindikasikan

pengembangan wilayah kota menjadi faktor meningkatnya debit aliran permukaan.

Kabeja *et al.* (2020) menyelidiki dampak dari dua program penghijauan yaitu Grain to Green Program (GGTP) dan Natural Forest Conservation Program (NFCP) di China terhadap debit puncak banjir di dua daerah tangkapan air. Data citra satelit Landsat digunakan antara lain data tahun 1990 dan 2016/2017 untuk evaluasi tutupan lahan. Respon hidrologi menggunakan pemodelan HEC-HMS dengan empat skenario tutupan lahan. Hasil analisis tutupan lahan menunjukkan area pemukiman dan hutan mengalami peningkatan sebesar 18% dan 6% berturut-turut di Yanhe serta 16% dan 8% di Guangyuan. Perubahan tutupan lahan tersebut berpengaruh pada menurunnya debit puncak banjir di Yanhe dan Guangyuan. Debit puncak banjir di Yanhe menurun sekitar 14% sedangkan di Guangyuan menurun sekitar 6%. Hal tersebut menunjukkan pengaruh dari program penghijauan yang dapat menurunkan debit puncak banjir walaupun secara bersamaan ada perluasan area pemukiman.

## **2. Pertanian dan Perkebunan**

Dalam rangka memenuhi kebutuhan penduduk dan peningkatan pendapatan, maka perlu adanya pengembangan dalam sektor pertanian dan perkebunan. Pengembangan sektor pertanian dan perkebunan membutuhkan area yang luas dan tanah yang subur. Hutan merupakan area yang cocok untuk diubah menjadi lahan pertanian dan perkebunan.

Karamage *et al.* (2017) melakukan penelitian terhadap perubahan area hutan dan padang rumput menjadi area pertanian dan bangunan dalam periode 1990 sampai tahun 2016 yang terjadi di negara Rwanda. Dalam penelitian diketahui terjadi perluasan area pertanian dan bangunan berturut-turut sebesar 135,3 % (8503,75 km<sup>2</sup>) dan 304,3 % (355,02 km<sup>2</sup>) sedangkan penyempitan area hutan dan padang rumput berturut-turut sebesar 64,5 % (7090,02 km<sup>2</sup>) dan 32,1 % (1715,26 km<sup>2</sup>). Analisis dalam mengestimasi kedalaman aliran permukaan digunakan model *WetSpa Extension*, yang didasarkan pada metode koefisien yang dimodifikasi sesuai karakteristik lereng, tata guna lahan, dan jenis tanah serta variasi kelembaban tanah, intensitas hujan dan durasi badai. Perluasan area

pertanian dan bangunan menyebabkan terjadinya peningkatan kedalaman aliran permukaan rata-rata tahunan sebesar 2,03 mm (0,38 %) per tahun selama periode 1990-2016.

Strapazan *et al.* (2019) membuat studi tentang perubahan tata guna lahan pada DAS Tibles, Runc dan Salauta di Romania pada periode 2000-2012. Masing-masing DAS memiliki luas 49 km<sup>2</sup>, 99 km<sup>2</sup> dan 144 km<sup>2</sup>. Metode perhitungan debit aliran yang dipakai adalah metode *Soil Conservation Service Curve Number (SCS-CN)* dengan 3 skenario berbeda berdasarkan kelengasan tanah yaitu *Antecedent Moisture Condition (AMC)* tipe I, II, dan III. Data curah hujan dan data elevasi muka air diperoleh dari 2 stasiun hidrometri dan 6 stasiun hujan. DAS Runc merupakan DAS yang paling besar terjadi perluasan area pertanian sebesar 13,7 % selama 12 tahun dari tahun 2000-2012. Sedangkan untuk periode tahun 2000-2006 terjadi perluasan area pertanian paling besar untuk DAS Runc, Tibles, dan Salauta berturut-turut yaitu sebesar 8,2 %, 6,8 %, 4,4 %. Akibat perluasan area pertanian selama periode 2000-2006, terjadi peningkatan volume aliran permukaan sebesar 11,6 %, 6,6 % dan 5,8 % untuk masing-masing DAS menurut skenario *AMC I*. Untuk periode 2006-2012 tidak terjadi peningkatan volume aliran permukaan yang signifikan karena stagnasi dalam eksploitasi area pertanian.

### **2.3 Kesimpulan Tinjauan Pustaka**

Sejumlah literatur yang telah ditinjau tentang kaitan antara perubahan tata guna lahan dan debit aliran telah memberikan gambaran mengenai topik tersebut. Pada tahap tinjauan pustaka yang telah dilakukan, perubahan lahan menjadi permukiman penduduk, komersial, dan industri merupakan jenis lahan yang paling besar meningkatkan debit aliran permukaan dibandingkan semisal lahan pertanian dan perkebunan. Hal itu karena area permukiman penduduk, komersial dan industri merupakan area dengan tingkat kedap air yang tinggi.

Terkait dengan metode dalam mengestimasi debit aliran, para peneliti menggunakan metode *Soil Conservation Service Curve Number (SCS-CN)* karena dianggap paling sesuai dengan penelitian mereka dan metode itu sudah lama

dikenal. Hal yang membedakan hanya pada jenis pemodelan yang digunakan dalam estimasi debit aliran permukaan. Pemodelan seperti *SWAT*, *HEC-HMS* dan *WetSpa Extension* merupakan contoh-contoh pemodelan yang digunakan oleh para peneliti dalam tinjauan pustaka ini.

## 2.4 Rekapitulasi Penelitian Terdahulu

Untuk memperjelas perbedaan dari setiap sumber pustaka yang ditinjau, penyajian dalam bentuk tabel harus dibuat. Berikut ini rekapitulasi hasil penelitian terdahulu yang dijadikan sebagai sumber dari tinjauan pustaka.

|------------------|---|---|---|--|--|
|                  | Assesing Land Use/Land Cover Change and Its Impact on Surface Runoff in The Sothern Part of The Tibles and Rodnei Mountains   | Modeling Rainfall-Runoff Response to Land Use and Land Cover Change in Rwanda (1990-2016)   | Long-term hydrological impacts of land use/land cover change from 1984 to 2010 in the Little Watershed, Tennessee                                   | Remote sensing- and GIS-based runoff modeling with the effect of land-use changes (a case study of Chocin Corporation)   | The Impact of Reforestation Induced Land Cover Change (1990–2017) on Flood Peak Discharge Using HEC-HMS Hydrological Model and Satellite Observations: A Study in Two Mountain Basins, China   |
| Hasil Penelitian | Akibat perluasan area pertanian selama periode 2000-2006, terjadi peningkatan volume aliran permukaan sebesar 11,6 %, 6,6 % dan 5,8 % untuk masing-masing DAS menurut skenario <i>AMC I</i> . | Terjadi peningkatan aliran permukaan rata-rata tahunan yang diakibatkan oleh perubahan area hutan menjadi lahan pertanian dan bangunan sebesar 2,03 mm per tahun selama 16 tahun. | Secara keseluruhan terjadi peningkatan debit aliran sebesar 3 % dan juga terjadi peningkatan sebesar >10 % pada daerah yang dekat dengan perkotaan. | Perubahan kedalaman limpasan paling besar disebabkan oleh urbanisasi yang mengubah nilai CN menjadi 92-100 pada area 43,87-45,32 km <sup>2</sup> . Sehingga peningkatan volume limpasan langsung dari 135,56 juta m <sup>3</sup> menjadi 141,49 juta m <sup>3</sup> dalam rentang tahun 2005-2010. | Program penghijauan yang dilakukan di China memberikan dampak pada penurunan debit puncak banjir di dua area studi, yaitu Yanhe dan Guangyuan. Meskipun area pemukiman mengalami perluasan, debit puncak banjir mengalami penurunan ketika dibarengi dengan program penghijauan. |

## 2.5 Keaslian Penelitian

Penelitian yang sedang dilakukan sekarang memiliki beberapa perbedaan dengan penelitian sebelumnya yang telah disebutkan di atas. Perbedaan utama terletak pada lokasi penelitian. Lokasi penelitian sekarang berada di DAS Bengawan Solo Hulu, sedangkan yang sebelumnya berada di beberapa DAS yang ada di luar negeri. Hal lainnya memiliki beberapa persamaan seperti penggunaan metode *Soil Conservation Service* (SCS) untuk menghitung hujan efektif, dan penggunaan *software* untuk melakukan analisis tutupan lahan.

## **BAB III**

### **LANDASAN TEORI**

#### **3.1 Umum**

Dalam sebuah penelitian, landasan teori perlu dibuat agar sebuah penelitian mempunyai dasar yang kokoh. Teori adalah seperangkat konsep, definisi, dan proposisi yang berfungsi untuk melihat fenomena secara sistematis, melalui spesifikasi hubungan antar variabel sehingga berguna untuk menjelaskan dan meramalkan fenomena. Teori yang digunakan harus mampu memperjelas masalah yang telah dirumuskan dan teori dijadikan sebagai referensi dalam menyusun instrumen penelitian (Sugiyono, 2015).

#### **3.2 Siklus Hidrologi dan Daerah Aliran Sungai**

##### **3.2.1 Siklus Hidrologi**

Chow *et al.* (1998) mendefinisikan siklus hidrologi sebagai perputaran air dari bumi ke atmosfer sampai kembali lagi ke bumi yang berlangsung secara terus menerus. Air yang ada di lautan dan permukaan tanah akan menguap menjadi uap air, kemudian uap air bergerak menuju atmosfer, uap air yang ada di atmosfer mengalami kondensasi membentuk awan hujan. Awan yang mengandung cukup uap air akan menurunkan hujan (*presipitasi*) pada wilayah lautan maupun daratan. Hujan yang jatuh dapat tertahan oleh berbagai jenis tanaman, dan yang tidak tertahan akan jatuh di atas permukaan tanah. Air yang berada di atas permukaan tanah akan meresap (*infiltrasi*) masuk ke bawah permukaan tanah, selanjutnya masuk lebih dalam (*perkolasi*) ke dalam tanah menjadi air tanah. Sedangkan air yang tidak meresap ke dalam permukaan tanah akan mengalir di atas permukaan tanah menjadi aliran permukaan (*surface runoff*) mengisi cekungan tanah, danau dan bergerak menuju sungai-sungai terdekat. Peristiwa tersebut terjadi terus menerus sepanjang waktu. Gambar 3.1 menjelaskan mengenai siklus hidrologi.

Gambar 3. 1 Siklus Hidrologi  
(Sumber : Chow *et al.* 1988)

### 3.2.2 Daerah Aliran Sungai (DAS)

Triatmodjo (2008) menjelaskan tentang daerah aliran sungai (DAS) sebagai daerah yang dibatasi oleh punggung-punggung gunung/pegunungan di mana air hujan yang jatuh di daerah tersebut akan mengalir menuju sungai utama pada suatu titik/stasiun yang ditinjau. Gambar 3.2 adalah contoh dari suatu DAS.

Gambar 3. 2 Daerah Aliran Sungai  
(Sumber : [www.ancientoaksfoundation.org](http://www.ancientoaksfoundation.org))

### 3.3 Hujan Kawasan

Curah hujan yang jatuh di suatu kawasan dapat diukur dengan menggunakan alat pengukur curah hujan yang ada pada setiap stasiun hujan. Curah hujan yang diukur hanya mewakili daerah di mana stasiun hujan berada. Untuk kawasan atau daerah yang luas perlu dipasang beberapa stasiun hujan, hasil pengukuran dari setiap stasiun hujan dapat memberikan nilai pengukuran yang berbeda. Triatmodjo (2008) menjelaskan perhitungan hujan rerata diperlukan dalam analisis hidrologi. Berikut adalah metode *thiessen* yang digunakan dalam perhitungan hujan rerata dalam penelitian ini.

Metode *Thiessen* dalam perhitungan hujan rerata menggunakan luas daerah yang mewakili setiap stasiun hujan. Apabila sebaran hujan di suatu DAS tidak merata maka metode *Thiessen* cocok digunakan untuk memperhitungkan hujan rerata. Langkah-langkah pembentukan poligon metode *Thiessen* dijelaskan sebagai berikut.

1. Menggambar letak stasiun hujan pada DAS.
2. Hubungkan stasiun yang telah digambar dengan garis lurus putus-putus.
3. Dibuat garis berat pada sisi segitiga dengan garis lurus penuh. Garis berat membentuk poligon yang mewakili luasan setiap stasiun hujan.
4. Luas tiap poligon diukur dan dikalikan dengan kedalaman hujan tiap stasiun di dalam poligon.
5. Lakukan langkah 4 untuk semua luas poligon dan stasiun hujan yang lain. Jumlahkan semua hasil perkalian dari langkah sebelumnya kemudian dibagi dengan luas total DAS yang ditinjau.

Bentuk persamaan hujan rerata metode *Thiessen* adalah sebagai berikut

$$\bar{p} = \frac{A_1 p_1 + A_2 p_2 + \dots + A_n p_n}{A_1 + A_2 + \dots + A_n} \quad (3.1)$$

dengan :

$\bar{p}$  = hujan rerata kawasan

$p_1, p_2, \dots, p_n$  = hujan di stasiun 1,2,3,...,n

$A_1, A_2, \dots, A_n$  = luas daerah yang mewakili stasiun 1,2,3,..., n

Gambar 3. 3 Metode *Thiessen*  
(Sumber : Chow, 1988)

### 3.4 Analisis Frekuensi

Kejadian – kejadian ekstrim seperti kekeringan dan banjir selalu dihadapi dalam melakukan analisis hidrologi. Perencanaan bangunan air harus mampu melewati peristiwa debit banjir maksimum yang mungkin terjadi. Keselamatan manusia dan keamanan fasilitas-fasilitas pendukung harus menjadi prioritas dalam perencanaan bangunan air sehingga dapat meminimalisir korban jiwa dan kerugian materil. Tujuan dilakukannya analisis frekuensi data hidrologi adalah mencari hubungan antara besarnya kejadian ekstrim dan frekuensi kejadian dengan menggunakan distribusi probabilitas (Triatmodjo, 2008).

### 3.4.1 Prinsip Statistik

#### 1. Tendensi sentral

Nilai rerata digunakan untuk pengukuran suatu distribusi dan dianggap cukup representatif dalam suatu distribusi. Bentuk nilai rerata adalah sebagai berikut.

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i \quad (3.2)$$

dengan :

$\bar{x}$  = rerata

$x_i$  = variabel *random*

$n$  = jumlah data

#### 2. Dispersi

Dalam sebuah seri data, tidak semua data hidrologi atau variat sama dengan nilai rerata, tetapi ada yang lebih besar atau lebih kecil dari nilai rerata. Besarnya sebaran variat di sekitar nilai reratanya disebut varian (*variance*) atau dispersi (*dispersion*).

Varian dapat dihitung menggunakan persamaan berikut.

$$s^2 = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2 \quad (3.3)$$

dengan  $s^2$  adalah varian. Akar dari varian,  $s$ , adalah deviasi standar,

$$s = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2} \quad (3.4)$$

koefisien varian adalah nilai perbandingan antara deviasi standar dan nilai rerata yang mempunyai bentuk

$$C_v = \frac{s}{\bar{x}} \quad (3.5)$$

Koefisien asimetri diberikan oleh bentuk berikut

$$a = \frac{n}{(n-1)(n-2)} \sum_{i=1}^n (x_i - \bar{x})^3 \quad (3.6)$$

Kemencengan diberikan oleh bentuk berikut

$$C_s = \frac{a}{s^3} \quad (3.7)$$

Untuk distribusi simetris,  $a = 0$  dan  $C_s = 0$ . Apabila distribusi condong ke kanan (distribusi dengan ekor panjang ke kanan),  $C_s > 0$ ; untuk bentuk condong ke kiri (distribusi dengan ekor panjang ke kiri),  $C_s < 0$ .

Koefisien kurtois diberikan oleh bentuk berikut ini.

$$C_k = \frac{n^2}{(n-1)(n-2)(n-3)s^4} \sum_{i=1}^n (x_i - \bar{x})^4 \quad (3.8)$$

### 3.4.2 Peiode Ulang

Triatmodjo (2008) mendefinisikan pengertian periode ulang (*return period*) sebagai berikut. Periode ulang (*return period*) didefinisikan sebagai waktu hipotetik di mana hujan atau debit dengan suatu besaran tertentu ( $x_T$ ) akan disamai atau dilampaui sekali dalam jangka waktu tersebut. Misalnya, intensitas hujan dalam satu hari adalah 300 mm akan terjadi 100 kali dalam kurun waktu 1000 tahun, maka peluang terjadinya hujan dengan intensitas tersebut adalah 0,1 (100/1000). Periode ulang dari peristiwa itu adalah 10 tahun (1/0,1). Dalam periode tersebut, kemungkinan terjadi intensitas hujan 300 mm/hari dapat terjadi beberapa kali atau tidak terjadi sama sekali.

### 3.4.3 Distribusi Probabilitas Kontinyu

Triatmodjo (2008) menjelaskan ada beberapa distribusi yang digunakan dalam analisis frekuensi untuk hidrologi seperti distribusi normal, log normal, Gumbel, Pearson, Log Pearson dan sebagainya seperti dalam beberapa penjelasan berikut.

#### 1. Distribusi Normal

Fungsi distribusi normal mempunyai bentuk seperti berikut,

$$p(X) = \frac{1}{\sigma\sqrt{2\pi}} e^{-(X-\mu)^2/(2\sigma^2)} \quad (3.9)$$

dengan  $X$  adalah variabel random dan  $p(X)$  adalah fungsi probabilitas kontinyu. Apabila variabel  $X$  ditulis dalam bentuk berikut,

$$z = \frac{X-\mu}{\sigma} \quad (3.10)$$

maka Persamaan (3.9) menjadi,

$$p(z) = \frac{1}{\sqrt{2\pi}} e^{-z^2/2} \quad (3.11)$$

dengan  $z$  adalah satuan standar, yang terdistribusi normal dengan rerata nol dan deviasi standar satu.

Persamaan (3.10) dapat ditulis dalam bentuk,

$$X = \mu + z\sigma \quad (3.12)$$

dengan  $z$  adalah faktor frekuensi dari distribusi normal. Pada umumnya, faktor frekuensi dari distribusi statistik diberi notasi  $K$ .

Fungsi densitas kumulatif (*CDF*) dapat diturunkan dengan integrasi dari fungsi densitas probabilitas menjadi persamaan berikut,

$$F(z) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^z e^{-z^2/2} \quad (3.13)$$

dengan  $F(z)$  adalah probabilitas kumulatif. Sri Harto (1993) dalam Triatmodjo (2008) memberikan sifat-sifat distribusi normal, yaitu nilai kemencengan (*skewness*) sama dengan nol ( $C_s \approx 0$ ) dan nilai koefisien kurtois  $C_k \approx 3$ . Selain itu terdapat sifat-sifat distribusi frekuensi kumulatif berikut ini.

$$P(\bar{x} - s) = 15,87 \%$$

$$P(\bar{x}) = 50 \%$$

$$P(\bar{x} + s) = 84,14 \%$$

Kemungkinan variat berada pada daerah  $(\bar{x} - s)$  dan  $(\bar{x} + s)$  adalah 68,27 % dan yang berada antara  $(\bar{x} - 2s)$  dan  $(\bar{x} + 2s)$  adalah 95,44 %.

## 2. Distribusi Lognormal

Penggunaan distribusi lognormal apabila nilai-nilai dari variabel *random* tidak mengikuti distribusi normal tetapi nilai logaritmanya memenuhi distribusi normal. Fungsi densitas probabilitas (*PDF*) diperoleh dengan melakukan transformasi, yang dalam hal ini digunakan persamaan transformasi berikut,

$$y = \ln x$$

atau

$$y = \log x$$

Parameter dari distribusi log normal adalah rerata dan deviasi standar dari  $y$  yaitu  $\mu_y$  dan  $\sigma_y$ . Dengan menggunakan transformasi tersebut maka,

$$p(X) = \frac{1}{\sigma_y \sqrt{2\pi}} e^{-(y - \mu_y)^2 / (2\sigma_y^2)}$$

Fungsi densitas kumulatif (*CDF*) dapat diturunkan dengan integrasi dari fungsi densitas probabilitas menghasilkan,

$$F(z) = \frac{1}{\sqrt{2\pi\sigma_y}} \int_{-\infty}^y e^{-(y-\mu_y)^2/(2\sigma_y^2)} dy$$

dengan  $F(z)$  adalah probabilitas kumulatif.

Sri Harto (1993) dalam Triatmodjo (2008) memberikan sifat-sifat distribusi log normal berikut,

$$1. \text{ Nilai kemencengan} : C_s = C_v^3 + 3C_v$$

$$2. \text{ Nilai kurtois} : C_k = C_v^8 + 6C_v^6 + 15C_v^4 + 16C_v^2 + 3$$

### 3. Distribusi Gumbel

Distribusi gumbel sering digunakan untuk analisis data maksimum, seperti untuk analisis frekuensi banjir. Fungsi densitas kumulatif mempunyai bentuk berikut,

$$F(x) = e^{-e^{-y}} \quad (3.14)$$

dengan :

$$y = \frac{x-u}{\alpha} \quad (3.15)$$

$$\alpha = \frac{\sqrt{6}s}{\pi} \quad (3.16)$$

$$u = \bar{x} - 0,5772\alpha \quad (3.17)$$

dengan :

$y$  = faktor reduksi gumbel

$u$  = modus dari distribusi (titik dari densitas probabilitas maksimum)

$s$  = deviasi standar

Distribusi gumbel mempunyai sifat bahwa koefisien skewness  $C_v = 1,1396$  dan koefisien kurtois  $C_v = 5,4002$  (Sri Harto, 1993 dalam Triatmodjo, 2008).

Penyelesaian dari persamaan menghasilkan,

$$y = -\ln \left[ \ln \left( \frac{1}{F(x)} \right) \right] \quad (3.18)$$

dari bentuk berikut,

$$\begin{aligned} \frac{1}{T} &= P(x \geq x_T) \\ &= 1 - P(x < x_T) \\ &= 1 - F(x_t) \end{aligned}$$

sehingga,

$$F(x_T) = \frac{T-1}{T} \quad (3.19)$$

Substitusi Persamaan (3.19) ke dalam Persamaan (3.18) menghasilkan,

$$y_T = -\ln \left[ \ln \left( \frac{T}{T-1} \right) \right] \quad (3.20)$$

Dari persamaan (3.15) diperoleh,

$$x_T = u + \alpha y_T \quad (3.21)$$

Distribusi Gumbel mempunyai sifat di bawah ini.

1. Koefisien skewness :  $C_s = 1,14$
2. Koefisien kurtois :  $C_k = 5,4$

Analisis frekuensi dengan menggunakan metode Gumbel juga sering dilakukan dengan persamaan berikut,

$$x = \bar{x} + Ks \quad (3.22)$$

dengan  $K$  adalah frekuensi faktor yang bisa dihitung dengan persamaan berikut,

$$y = y_n + K\sigma_n \quad (3.23)$$

dengan  $y$  adalah faktor reduksi Gumbel seperti diberikan oleh persamaan (3.18),  $y_n$  dan  $\sigma_n$  adalah nilai rerata dan deviasi standar dari variat Gumbel, yang nilainya tergantung dari jumlah data seperti diberikan dalam Tabel 3.1.

Tabel 3. 1 Nilai  $y_n$  dan  $\sigma_n$  Fungsi Jumlah Data

| n  | $y_n$  | $\sigma_n$ | n  | $y_n$  | $\sigma_n$ | n  | $y_n$  | $\sigma_n$ |

(Sumber : Triatmodjo, 2008)

Dari persamaan (3.22) dan (3.23) diperoleh,

$$x = \bar{x} + \frac{y-y_n}{\sigma_n} s \quad (3.24)$$

dan dengan Persamaan (3.20) diperoleh

$$x = \bar{x} - \frac{\ln \ln \frac{T}{T-1} + y_n}{\sigma_n} \quad (3.25)$$

#### 4. Distribusi Log Pearson III

Log Pearson III banyak digunakan dalam hidrologi terutama untuk analisis data maksimum. Bentuk log Pearson III merupakan transformasi dari distribusi Pearson III dengan transformasi variat menjadi nilai log. *PDF* dari distribusi log Pearson III mempunyai bentuk berikut ini.

$$p(x) = \frac{x^{\gamma-1} e^{-x/\beta}}{\beta^{\gamma} \Gamma(\gamma)} \quad (3.26)$$

dengan  $\beta$  dan  $\gamma$  adalah parameter.

Rerata dari distribusi gamma adalah  $\beta\gamma$ , varian adalah  $\beta^2\gamma$ , dan kemencengan adalah  $2/(\gamma)^{1/2}$ . Persamaan *CDF* mempunyai bentuk,

$$\Gamma(\gamma) = \int_0^{\infty} x^{\gamma} e^{-x} dx \quad (3.27)$$

Bentuk kumulatif dari distribusi log Pearson III dengan nilai variat  $X$  apabila digambarkan pada kertas probabilitas logaritmik akan membentuk persamaan garis lurus. Persamaan tersebut mempunyai bentuk berikut,

$$y_T = \bar{y} + K_T s_y \quad (3.28)$$

dengan :

$y_T$  = nilai logaritmik dari  $x$  dengan periode ulang  $T$

$\bar{y}$  = nilai rerata dari  $y_i$

$K_T$  = faktor frekuensi, yang merupakan fungsi dari probabilitas (atau periode ulang) dari koefisien kemencengan  $C_{sy}$ .

Distribusi log Pearson III digunakan apabila parameter statistik  $C_s$  dan  $C_k$  mempunyai nilai selain dari parameter statistik untuk distribusi yang lain (normal, log normal, dan Gumbel). Penggunaan metode log Pearson III dilakukan dengan menggunakan langkah-langkah berikut ini.

1. Data debit banjir maksimum tahunan disusun dalam tabel.
2. Hitung nilai logaritma dari data debit banjir tersebut dengan transformasi

$$y_i = \ln x_i$$

atau

$$y_i = \log x_i$$

3. Hitung nilai rerata  $\bar{y}$ , deviasi standar  $s_y$ , koefisien kemencengan  $C_{sy}$  dari nilai logaritma  $y_i$ .
4. Dihitung nilai  $y_i$  untuk berbagai periode ulang yang dikehendaki dengan menggunakan Persamaan (3.28).
5. Hitung debit banjir atau hujan  $x_T$  untuk setiap periode ulang dengan menghitung nilai anti-lognya,

$$x_T = \text{arc ln } y$$

atau

$$x_T = \text{arc log } y$$

### 3.5 Distribusi Hujan Rencana

Triatmodjo (2008) menjelaskan beberapa metode yang digunakan untuk menentukan distribusi hujan rencana. Untuk penelitian ini digunakan metode Mononobe dalam penentuan Intensitas-Durasi-Frekuensi (IDF) serta *Alternating Block Method (ABM)* dan Metode Tadashi Tanimoto untuk analisis distribusi hujan jam-jaman.

#### 3.5.1 Kurva IDF dengan Metode Mononobe

Intensitas-Durasi-Frekuensi (IDF) merupakan kurva yang memberikan hubungan antara intensitas hujan sebagai ordinat dan durasi hujan sebagai absis. Kurva IDF dapat dibuat jika durasi hujan singkat tersedia dari stasiun pencatat hujan otomatis. Mononobe mengusulkan persamaan berikut untuk menurunkan kurva IDF (Suyono dan Takeda, 1983 dalam Triatmodjo 2008).

$$I_t = \frac{R_{24}}{24} \left( \frac{24}{t} \right)^{\frac{2}{3}} \quad (3.29)$$

dengan :

$I_t$  = intensitas hujan untuk lama hujan  $t$  ( $mm/jam$ )

$t$  = durasi hujan ( $jam$ )

$R_{24}$  = curah hujan maksimum selama 24 jam ( $mm$ )

#### 3.5.2 *Alternating Block Method (ABM)*

*Hyetograph* merupakan hujan harian rancangan yang didistribusikan menjadi kedalaman hujan jam-jaman. *Alternating Block Method (ABM)* merupakan cara yang digunakan untuk membuat *hyetograph* rencana dari kurva IDF. Kedalaman hujan yang diperoleh merupakan perkalian antara intensitas hujan dan durasi waktu. Perbedaan antara nilai kedalaman hujan yang berurutan merupakan pertambahan hujan dalam interval waktu  $\Delta t$ . Pertambahan hujan tersebut (blok-blok), diurutkan kembali ke dalam rangkaian waktu dengan intensitas hujan maksimum berada di tengah-tengah  $T_d$  dan sisanya disusun dalam urutan menurun secara bolak-balik pada kanan dan kiri dari blok tengah (Triatmodjo, 2008).

### 3.5.3 Metode Tadashi Tanimoto

Metode ini merupakan hasil penelitian yang dilakukan oleh Tadashi Tanimoto terhadap pola hujan yang terjadi di Pulau Jawa. Distribusi hujan jam-jaman yang terjadi di Pulau Jawa menurut Tadashi Tanimoto diberikan dalam tabel 3.2 berikut

Tabel 3. 2 Distribusi Hujan Tadashi Tanimoto

| Jam ke-      | 1  | 2  | 3  | 4  | 5  | 6    | 7    | 8   |
|--------------|----|----|----|----|----|------|------|-----|
| % Distribusi | 26 | 24 | 17 | 13 | 7  | 5,5  | 4    | 3,5 |
| % Kumulatif  | 26 | 50 | 67 | 80 | 87 | 92,5 | 96,5 | 100 |

### 3.6 Sistem Informasi Geografi (SIG)

Sistem informasi geografi (SIG) adalah perangkat lunak terintegrasi yang dirancang untuk digunakan dengan data geografi, yang menangani berbagai tugas seperti input data, penyimpanan, pemulihan dan pengeluaran serta berbagai proses deskriptif dan analisis (Calkins dan Tomlinson, 1977 dalam Weng, 2010). SIG menangani data spasial dan data atribut untuk menggambarkan fitur geografi. Tugas dasar dari SIG adalah input data, menyimpan, memproses dan mengeluarkan.

### 3.7 Analisis Tutupan Lahan

Analisis tutupan lahan membagi peta lahan menjadi beberapa jenis/kategori lahan yang ditentukan sesuai dengan kebutuhan penelitian. Data yang digunakan dapat diambil dari citra satelit. *Maximum likelihood classification* merupakan salah satu metode yang digunakan untuk menentukan jenis tutupan lahan yang digunakan dalam penelitian. Metode ini dapat digunakan melalui aplikasi ArcGIS. (Haris dan Ventura, 1995 ; Mesev, 1998 dalam Weng, 2010).

### 3.8 Hujan Efektif

Hujan yang jatuh dipermukaan bumi sebagian akan mengalami abstraksi (*abstraction*) dan sebagian lainnya akan mengalir menjadi aliran langsung. Hujan yang jatuh menjadi aliran langsung di sebut hujan efektif.

Metode SCS (*Soil Conservation Service*) merupakan salah satu metode yang digunakan untuk menghitung hujan efektif. Berikut adalah persamaan untuk menghitung hujan efektif dengan metode SCS.

$$P_e = \frac{(P-0,2S)^2}{P+0,8S} \quad (3.30)$$

Nilai  $S$  dihitung dengan persamaan,

$$S = \frac{25400}{CN} - 254 \quad (3.31)$$

dimana  $CN$  adalah *Curve Number* yang merupakan fungsi dari karakteristik DAS seperti tipe tanah, tanaman penutup, tata guna lahan, kelembaban dan cara pengerjaan tanah. Tabel 3.3 memberikan nilai  $CN$  untuk berbagai jenis tata guna lahan. Nilai  $CN$  bervariasi antara 0 sampai 100. Untuk  $CN = 100$  (permukaan lahan kedap air), dari persamaan diperoleh nilai  $S = 0$  sehingga  $p_e = p$ , artinya semua hujan yang jatuh berubah menjadi limpasan langsung. Apabila lahan terdiri dari beberapa jenis tataguna lahan dan tipe tanah maka dihitung nilai  $CN$  komposit.

Tabel 3. 3 Nilai CN untuk Beberapa Tataguna Lahan

| Jenis Tataguna Lahan   | Tipe Tanah |    |    |    |
|--|------------|----|----|----|
|  | A          | B  | C  | D  |
| Tanah yang diolah dan ditanami                               |            |    |    |    |
| - dengan konservasi  | 72         | 81 | 88 | 91 |
| - tanpa konservasi   | 62         | 71 | 78 | 81 |
| Padang Rumput  |            |    |    |    |
| - kondisi jelek  | 68         | 79 | 86 | 89 |
| - kondisi baik   | 39         | 61 | 74 | 80 |
| Padang Rumput : kondisi baik                                 | 30         | 58 | 71 | 78 |
| Hutan  |            |    |    |    |
| - tanaman jarang, penutupan jelek                            | 45         | 66 | 77 | 83 |
| - penutupan baik   | 49         | 69 | 79 | 84 |
| Tempat terbuka, halaman rumput, lapangan golf, kuburan, dsb. |            |    |    |    |
| - kondisi baik : rumput menutup 75 % atau lebih luasan       | 39         | 61 | 74 | 80 |
| - kondisi sedang : rumput menutup 50 % - 75 % luasan         | 49         | 69 | 79 | 84 |

| Jenis Tataguna Lahan                          | Tipe Tanah |    |    |    |
|---|------------|----|----|----|
|   | A          | B  | C  | D  |
| Daerah Perniagaan dan bisnis (85 % kedap air) | 89         | 92 | 94 | 95 |
| Daerah Industri (72 % kedap air)              | 81         | 88 | 91 | 93 |
| Permukiman                                    |            |    |    |    |
| Luas  |            |    |    |    |
| % Kedap Air                                   |            |    |    |    |
| 1/8 acre atau kurang                          | 65         | 77 | 85 | 90 |
| 1/4 acre                                      | 38         | 61 | 75 | 83 |
| 1/3 acre                                      | 30         | 57 | 72 | 81 |
| 1/2 acre                                      | 25         | 54 | 70 | 80 |
| 1 acre  | 20         | 51 | 68 | 79 |
| Tempat Parkir, atap, jalan mobil (dihalaman)  | 98         | 98 | 98 | 98 |
| Jalan   |            |    |    |    |
| - perkerasan dengan drainasi                  | 98         | 98 | 98 | 98 |
| - kerikil                                     | 76         | 85 | 89 | 91 |
| - tanah                                       | 72         | 82 | 87 | 89 |

(Sumber : Triatmodjo, 2008)

Untuk kondisi kering (*AMC I*) atau kondisi basah (*AMC III*), nilai *CN* ekuivalen dapat dihitung dengan Persamaan (3.33) dan Persamaan (3.34). Tabel 3.4 memberikan *AMC* untuk masing-masing kelas.

$$CN(I) = \frac{4,2 CN(II)}{10 - 0,058 CN(II)} \quad (3.32)$$

dan

$$CN(III) = \frac{23CN(II)}{10 - 0,13CN(II)} \quad (3.33)$$

Tabel 3. 4 Memberikan *AMC* untuk masing-masing kelas

| Kelas <i>AMC</i> | Jumlah hujan selama 5 hari terdahulu (cm) |                 |
|------------------|---|-----------------|
|                  | Musim kering                              | Musim semi      |
| I                | kurang dari 1,3                           | kurang dari 3,6 |
| II               | 1,3 sampai 2,8                            | 3,6 sampai 5,3  |
| III              | lebih dari 2,8                            | lebih dari 5,3  |

(Sumber : Triatmodjo, 2008)

Selain itu jenis tanah juga sangat berpengaruh terhadap nilai hujan efektif. Tanah berpasir mempunyai nilai *infiltrasi* tinggi sehingga hujan efektif kecil, sebaliknya nilai *infiltrasi* tanah lempung sangat kecil sebagian besar hujan yang

jatuh di permukaan tanah menjadi limpasan permukaan. Jenis tanah dibagi dalam empat kelompok yaitu

Kelompok A : terdiri dari tanah dengan potensi limpasan rendah, mempunyai laju *infiltrasi* tinggi. Terutama untuk tanah pasir (*deep sand*) dengan *silty* dan *clay* sangat sedikit, juga kerikil (*gravel*) yang sangat lulus air.

Kelompok B : terdiri dari tanah dengan potensi limpasan, laju *infiltrasi* sedang. Tanah berbutir sedang (*sandy soils*) dengan laju meloloskan air sedang.

Kelompok C : terdiri dari tanah dengan potensi limpasan agak tinggi, laju *infiltrasi* lambat jika tanah tersebut sepenuhnya basah. Tanah berbutir sedang sampai halus (*clay dan colloids*) dengan laju meloloskan air lambat.

Kelompok D: terdiri dari tanah dengan potensi limpasan tinggi, mempunyai laju *infiltrasi* sangat lambat. Terutama tanah liat (*clay*) dengan kembang susut (*swelling*) tinggi, tanah dengan muka air tanah permanen tinggi, tanah lempung di dekat permukaan dan tanah yang dilapisi dengan bahan kedap air. Tanah ini mempunyai laju meloloskan air sangat lambat.

Tabel 3.5 memberikan klasifikasi tanah untuk berbagai jenis tanah. Dalam tabel tersebut juga diberikan perkiraan nilai laju *infiltrasi* minimumnya.

Tabel 3. 5 Klasifikasi Tanah Secara Hidrologi Berdasar Tekstur Tanah

| Tekstur Tanah   | Laju Infiltrasi Minimum<br>(fc) (mm/jam) | Pengelompokan Tanah<br>Secara Hidrologi |
|-----------------|--|---|
| Sand            | 210                                      | A                                       |
| Loamy sand      | 61                                       | A                                       |
| Sandy loam      | 26                                       | B                                       |
| Loam            | 13                                       | B                                       |
| Silty loam      | 6,9                                      | C                                       |
| Sandy clay loam | 4,3                                      | C                                       |

| Tekstur Tanah   | Laju Infiltrasi Minimum<br>(fc) (mm/jam) | Pengelompokan Tanah<br>Secara Hidrologi |
|-----------------|--|---|
| Silty clay loam | 2,3                                      | D                                       |
| Clay loam       | 1,5                                      | D                                       |
| Sandy clay      | 1,3                                      | D                                       |
| Silty clay      | 1,0                                      | D                                       |
| Clay            | 0,5                                      | D                                       |

(Sumber : Triatmodjo, 2008)

### 3.9 Aliran Dasar (*Baseflow*)

Perhitungan aliran dasar (*baseflow*) dapat dilakukan dengan salah satu persamaan dalam Hidrograf Satuan Sintetis (HSS) GAMA 1 yang dikembangkan oleh Sri Harto (1993). Berikut ini adalah persamaan untuk menghitung aliran dasar (*baseflow*) pada penelitian kali ini

$$Q_b = 0,4175 A^{0,6444} D^{0,9430} \quad (3.34)$$

$$D = \frac{LN}{A} \quad (3.35)$$

dengan :

$Q_b$  = Aliran dasar (m<sup>3</sup>/detik)

$D$  = Kerapatan jaringan kuras

$A$  = Luas Das (km<sup>2</sup>)

$LN$  = Panjang sungai semua tingkat (km)

### 3.10 Hidrograf Satuan Sintetis (HSS)

#### 3.10.1 HSS Nakayasu

Hidrograf satuan sintetis Nakayasu adalah rumus yang dikembangkan oleh Nakayasu berdasarkan penyelidikannya terhadap sungai-sungai di Jepang (Soemarto, 1995).

$$Q_p = \frac{1}{3,6} \left( \frac{A R_e}{0,3T_p + T_{0,3}} \right) \quad (3.36)$$

$$T_p = t_g + 0,8T_r \quad (3.37)$$

$$t_g = 0,4 + 0,058 L \quad \text{untuk } L > 15 \text{ km} \quad (3.38)$$

$$t_g = 0,4 L^{0,7} \quad \text{untuk } L < 15 \text{ km} \quad (3.39)$$

$$T_{0,3} = \alpha t_g \quad (3.40)$$

$$T_r = 0,75 t_g \text{ sampai } t_g \quad (3.41)$$

dengan :

$Q_p$  = debit puncak banjir

$A$  = luas DAS ( $km^2$ )

$R_e$  = curah hujan efektif ( $l \text{ mm}$ )

$T_p$  = waktu dari permulaan banjir sampai puncak hidrograf ( $jam$ )

$T_{0,3}$  = waktu dari puncak banjir sampai 0,3 kali debit puncak ( $jam$ )

$t_g$  = waktu konsentrasi ( $jam$ )

$T_r$  = satuan waktu dari curah hujan ( $jam$ )

$\alpha$  = koefisien karakteristik DAS biasanya diambil 2

$L$  = panjang sungai utama ( $km$ )

Bentuk hidrograf satuan diberikan oleh persamaan berikut.

a. Pada kurva naik ( $0 < t < T_p$ )

$$Q_t = Q_p \left( \frac{t}{T_p} \right)^{2,4} \quad (3.42)$$

b. Pada kurva turun ( $T_p < t < T_p + T_{0,3}$ )

$$Q_t = Q_p \times 0,3^{(t-T_p)/T_{0,3}} \quad (3.43)$$

c. Pada kurva turun  $T_p + T_{0,3} < t < T_p + T_{0,3} + 1,5T_{0,3}$

$$Q_p = Q_p \times 0,3^{[(t-T_p)+(0,5T_{0,3})]/(1,5T_{0,3})} \quad (3.44)$$

d. Pada kurva turun ( $t > T_p + T_{0,3} + 1,5T_{0,3}$ )

$$Q_t = Q_p \times 0,3^{[(t-T_p)+(1,5T_{0,3})]/(2T_{0,3})} \quad (3.45)$$

### 3.10.2 HSS Soil Conservation Service (SCS)

Hidrograf SCS adalah hidrograf tak berdimensi yang dikembangkan berdasarkan analisis sejumlah besar hidrograf satuan dari data lapangan dengan berbagai ukuran dan lokasi DAS yang berbeda (Triatmodjo, 2008). Nilai Ordinat dan absis pada HSS SCS diberikan dalam tabel 3.6 berikut

Tabel 3. 6 HSS *Soil Conservation Service (SCS)*

| $t/T_p$ | $q/Q_p$ | $t/T_p$ | $q/Q_p$ | $t/T_p$ | $q/Q_p$ |
|---------|---------|---------|---------|---------|---------|
| 0       | 0       | 1       | 1       | 2,4     | 0,18    |
| 0,1     | 0,015   | 1,1     | 0,98    | 2,6     | 0,13    |
| 0,2     | 0,075   | 1,2     | 0,92    | 2,8     | 0,098   |
| 0,3     | 0,16    | 1,3     | 0,84    | 3       | 0,075   |
| 0,4     | 0,28    | 1,4     | 0,75    | 3,5     | 0,036   |
| 0,5     | 0,43    | 1,5     | 0,66    | 4       | 0,018   |
| 0,6     | 0,6     | 1,6     | 0,56    | 4,5     | 0,009   |
| 0,7     | 0,77    | 1,8     | 0,42    | 5       | 0,004   |
| 0,8     | 0,89    | 2       | 0,32    |         |         |
| 0,9     | 0,97    | 2,2     | 0,24    |         |         |

Rumus untuk menghitung debit puncak dan waktu puncak hidrograf diberikan dalam persamaan-persamaan berikut

$$Q_p = \frac{0,208A}{T_p} \quad (3.46)$$

$$T_p = \frac{t_r}{2} + t_c \quad (3.47)$$

dengan :

$Q_p$  = debit puncak hidrograf ( $m^3/d$ )

$T_p$  = waktu puncak hidrograf (*jam*)

## **BAB IV METODE PENELITIAN**

### **4.1 Obyek Penelitian**

Obyek yang menjadi penelitian ini adalah daerah aliran sungai (DAS) Bengawan Solo Hulu. Penentuan lokasi ini berdasarkan ketersediaan data yang telah diperoleh dari Balai Besar Wilayah Sungai Bengawan Solo. Setelah mendapatkan data curah hujan harian, lokasi setiap stasiun curah hujan yang memiliki data lengkap minimal 10 tahun kemudian diplotkan di Google Earth bersama dengan peta DAS Bengawan Solo Hulu. Hasil *plotting* memperlihatkan banyak lokasi stasiun hujan dengan data terlengkap berada pada bagian hulu dari DAS Bengawan Solo. Sehingga lokasi yang dijadikan obyek penelitian merupakan DAS Bengawan Solo Hulu sampai dengan ruas di hilir *junction* Sungai Madiun.

### **4.2 Pengumpulan Data**

Penelitian ini membutuhkan sejumlah data yang dianggap berkaitan dengan penelitian. Sejumlah data yang dibutuhkan seperti data curah hujan dari beberapa stasiun hujan selama periode tertentu dan data citra satelit. Beberapa data yang disebutkan sebelumnya didapatkan dari instansi pemerintah dan dari sumber penyedia data terkait.

Data citra satelit yang digunakan dalam penelitian diperoleh dengan mengunduh data dari salah satu penyedia data citra satelit yang ada. Penyedia data citra satelit yang ada salah satunya adalah *United States Geological Survey (USGS)*. Data citra satelit yang diunduh merupakan data yang sesuai dengan lokasi obyek penelitian dan periode waktu sesuai dengan kriteria penelitian.

Data curah hujan, peta lokasi stasiun hujan, data tinggi muka air dan peta lokasi *Automatic Water Level Recorder (AWLR)* yang akan digunakan dalam analisis diperoleh dari instansi pemerintah terkait. Data tersebut diperoleh dari

Balai Besar Wilayah Sungai Bengawan Solo yang berada di Kabupaten Sukoharjo, Jawa Tengah.

Peta jaringan sungai yang digunakan untuk perhitungan aliran dasar (*baseflow*) didapatkan dari situs Ina-Geoportal.

### **4.3 Analisis Data**

#### **4.3.1 Perhitungan Hujan Kawasan**

Data curah hujan yang diperoleh dari beberapa stasiun hujan harus ditentukan nilai reratanya. Metode yang digunakan dalam penelitian ini menggunakan metode *Thiessen*. Pemilihan metode *Thiessen* untuk perhitungan hujan kawasan karena metode ini dianggap lebih teliti dari metode *aritmatik aljabar* dan lebih mudah dikerjakan daripada metode *isohiet*.

#### **4.3.2 Analisis Frekuensi**

##### **1. Periode Ulang**

Dalam perencanaan bangunan air, digunakan hujan atau debit rencana menurut beberapa periode ulang tertentu sesuai yang ditetapkan oleh perencana. Hujan atau debit rencana sesuai periode kala ulang tertentu mempengaruhi besarnya dimensi suatu bangunan air. Periode ulang seperti 2, 5, 10, 25, 50, dan 100 tahun lazim digunakan dalam perencanaan bangunan air.

##### **2. Penentuan Distribusi Probabilitas**

Data curah hujan yang didapatkan perlu dilakukan penentuan jenis distribusi yang sesuai dengan kaidah statistika yang tersedia. Jenis distribusi probabilitas seperti distribusi normal, log normal, Gumbel dan log Pearson III biasa digunakan dalam penentuan jenis distribusi untuk data hidrologi. Penentuan jenis distribusi mempengaruhi besarnya nilai hujan rencana menurut beberapa periode ulang tertentu yang digunakan dalam penelitian ini. Hasil dari tahap ini akan didapatkan nilai dari curah hujan rencana menurut beberapa periode ulang.

### 4.3.3 Analisis Tutupan Lahan

Data citra satelit *Landsat* yang telah diperoleh sebelumnya kemudian dianalisis untuk mengetahui perubahan tata guna lahan yang terjadi selama periode tahun 2015 sampai 2019. Luas area yang dianalisis merupakan daerah aliran sungai (DAS) yang telah ditentukan sebagai obyek penelitian. Analisis perubahan tata guna lahan mengklasifikasikan jenis tutupan lahan menjadi beberapa kategori sesuai dengan metode yang digunakan dalam analisis hujan efektif. Penelitian ini menggunakan metode *Soil Conservation Service (SCS)* untuk menghitung hujan efektif sehingga dalam membuat klasifikasi lahan disesuaikan menurut beberapa kategori yang ada dalam metode *SCS*. Klasifikasi lahan yang sesuai *SCS* dibagi menjadi beberapa kategori seperti daerah permukiman, industri, vegetasi, jalan, dan lahan terbuka. Hasil yang didapatkan berupa nilai *curve number (CN)* untuk masing-masing kategori jenis lahan. Nilai *CN* dari analisis tutupan lahan digunakan untuk perhitungan hujan efektif.

### 4.3.4 Intensitas Hujan dan Hyetograph

#### 1. Intensitas Hujan

Nilai curah hujan yang diperoleh pada tahap sebelumnya merupakan nilai curah hujan harian. Dalam perencanaan bangunan air data yang dibutuhkan merupakan data curah hujan jam-jaman. Untuk mengubah data curah hujan harian menjadi intensitas curah hujan jam-jaman dikenal beberapa metode yang sering digunakan oleh para perencana. Penelitian ini menggunakan metode *Mononobe* untuk mengubah curah hujan efektif harian menjadi intensitas curah hujan jam-jaman untuk menurunkan kurva Intensitas-Durasi-Frekuensi (IDF).

#### 2. Hyetograph

*Hyetograph* merupakan hujan rencana yang didistribusikan menjadi kedalaman hujan jam-jaman. Dalam mendistribusikan hujan rencana perlu diketahui pola distribusi hujan jam-jaman. Beberapa metode yang digunakan untuk mengubah hujan harian menjadi hujan jam-jaman adalah *Alternating Block Method (ABM)* dan Metode *Tadashi Tanimoto*. Kurva IDF yang sudah diperoleh digunakan untuk membuat *hyetograph* menggunakan metode *ABM*

dan hasilnya digunakan dalam perhitungan debit dengan hidrograf satuan sintetis sedangkan untuk metode *Tadashi Tanimoto* dapat langsung mengubah hujan harian ke dalam hujan jam-jaman tanpa perlu membuat kurva IDF terlebih dahulu.

#### **4.3.5 Hujan Efektif**

Curah hujan yang jatuh akan mengalami beberapa peristiwa seperti meresap kedalam tanah, tertahan oleh cekungan tanah dan melimpas di atas permukaan tanah. Hujan yang melimpas di atas permukaan tanah disebut sebagai hujan efektif. Dalam penelitian ini digunakan metode *Soil Conservation Service (SCS)* untuk menghitung nilai hujan efektif. Kedalaman hujan yang digunakan untuk menghitung hujan efektif merupakan hujan rencana dari beberapa periode ulang yang telah dihitung sebelumnya. Hujan efektif yang diperoleh akan digunakan untuk menghitung debit dari *surface runoff*.

#### **4.3.6 Perhitungan Baseflow**

Aliran dasar (*baseflow*) merupakan salah satu komponen dari suatu hidrograf sehingga nilai *baseflow* perlu dihitung untuk penggambaran hidrograf. *Baseflow* sendiri dapat terdiri dari aliran air tanah (*groundwater flow*) dan aliran antara (*interflow*). Pada penelitian ini digunakan persamaan dari Hidrograf Satuan Sintetis (HSS) GAMA 1 untuk perhitungan nilai *baseflow*.

#### **4.3.7 Perhitungan Hidrograf Satuan Sintetis (HSS)**

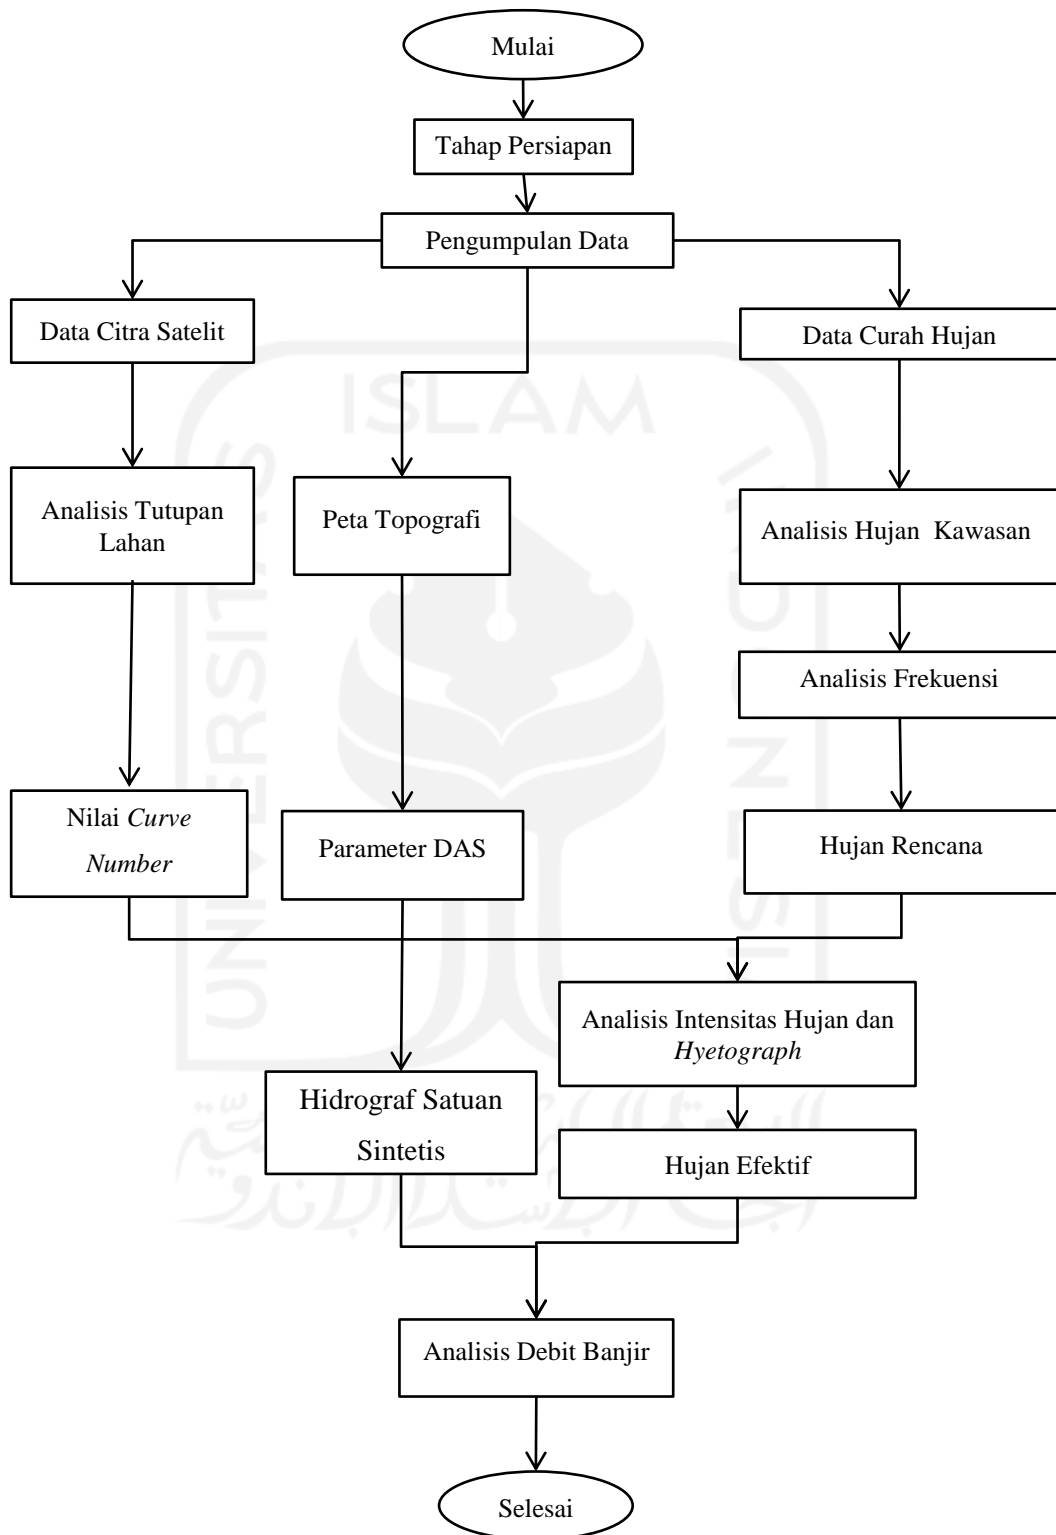

Setelah data-data yang dibutuhkan sudah lengkap maka tahap terakhir dilakukan perhitungan besarnya debit dengan metode yang sudah ditetapkan. Dalam penelitian ini digunakan metode HSS Nakayasu dan HSS *Soil Conservation Service (SCS)* untuk menganalisis hidrograf satuan sintetis.

#### **4.3.8 Perhitungan Debit Banjir**

Tahap terakhir yaitu menghitung debit banjir dengan cara menjumlahkan debit *baseflow* dan debit dari hidrograf satuan sintetis pada jam yang sama.

### **4.4 Diagram Alir**

Diagram alir digunakan untuk memberikan gambaran mengenai tahapan-tahapan yang dilakukan selama penelitian. Berikut adalah diagram aliran yang menggambarkan tahapan penelitian ini.

Gambar 4. 1 Diagram Alir Penelitian  
(Sumber : Sutyono, 2019)

## BAB V ANALISIS DAN PEMBAHASAN

### 5.1 Hujan Kawasan

Nilai rerata curah hujan dari beberapa stasiun yang ada pada suatu daerah aliran sungai (DAS) perlu dihitung untuk mencari nilai rerata yang mewakili curah hujan yang terjadi pada suatu DAS. Berikut ini adalah perhitungan hujan kawasan dengan menggunakan Metode Thiessen pada DAS Bengawan Solo Hulu dalam penelitian ini.

#### 5.1.1 Luas Daerah Yang Diwakili Setiap Stasiun

Dengan menggunakan Metode Thiessen, luas daerah yang diwakili setiap stasiun hujan diperlihatkan dalam gambar berikut ini.

Gambar 5. 1 Luas Daerah Yang Diwakili Setiap Stasiun Hujan Berdasarkan Metode Thiessen

Nilai luas daerah yang diwakili setiap stasiun hujan seperti dalam tabel berikut ini.

Tabel 5. 1 Luasan Yang Diwakili Setiap Stasiun Hujan

| Luasan                         | Luasan Stasiun  |                 |                 |                 |                 |                 |                 |                 |                 |
|--------------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|

### 5.1.2 Curah Hujan Rerata

Perhitungan curah hujan rerata menggunakan Metode Thiessen dihitung dengan persamaan 3. Berikut ini adalah perhitungan curah hujan kawasan untuk tanggal 1 Januari 1996

$$\begin{aligned}
 \bar{p}_{1996} &= \frac{656,48}{6155,89} \times 0 + \frac{1209,5}{6155,89} \times 0 + \frac{611,95}{6155,89} \times 11,1 + \frac{1003,26}{6155,89} \times 0 + \\
 &\quad \frac{1207,45}{6155,89} \times 15 + \frac{469,97}{6155,89} \times 0 + \frac{772,59}{6155,89} \times 9 + \frac{224,69}{6155,89} \times 0 \\
 &= 0 + 0 + 1,103 + 0 + 2,94 + 0 + 1,13 + 0 \\
 &= 5,173 \text{ mm}
 \end{aligned}$$

Untuk perhitungan curah hujan kawasan pada tanggal-tanggal lainnya dilakukan seperti pada perhitungan tanggal 1 Januari 1996 dan diambil curah hujan maksimum untuk masing-masing bulan pada tahun yang sama dan hasilnya diberikan pada tabel berikut ini.

Tabel 5. 2 Curah Hujan Kawasan

| Tahun | Curah Hujan Harian Maksimum Kawasan (mm) |      |      |      |      |      |      |      |      |      |      |       |       |
|-------|--|------|------|------|------|------|------|------|------|------|------|-------|-------|
|       | Jan                                      | Feb  | Mar  | Apr  | Mei  | Jun  | Jul  | Agst | Sep  | Okt  | Nop  | Des   | Maks  |
| 1996  | 58,4                                     | 47,1 | 31,5 | 18,1 | 10,6 | 7,9  | 4,7  | 34,5 | 6,4  | 39,4 | 41,7 | 31,4  | 58,4  |
| 1997  | 33,5                                     | 45,9 | 24,4 | 17,8 | 22,7 | 23,4 | 10,4 | 1,6  | 0,3  | 5,3  | 26,0 | 32,5  | 45,9  |
| 1998  | 34,0                                     | 28,6 | 25,8 | 54,2 | 31,1 | 40,3 | 18,5 | 6,3  | 16,9 | 46,0 | 32,2 | 39,5  | 54,2  |
| 1999  | 46,4                                     | 52,8 | 47,7 | 35,7 | 20,5 | 16,5 | 7,9  | 13,0 | 4,3  | 23,7 | 52,2 | 37,2  | 52,8  |
| 2000  | 30,2                                     | 36,6 | 36,7 | 33,9 | 27,2 | 6,2  | 2,9  | 12,1 | 8,2  | 31,0 | 48,5 | 30,9  | 48,5  |
| 2001  | 60,5                                     | 39,6 | 44,4 | 30,4 | 39,1 | 12,5 | 9,8  | 0,0  | 12,3 | 36,8 | 42,8 | 13,5  | 60,5  |
| 2002  | 55,5                                     | 93,0 | 32,6 | 43,4 | 19,0 | 18,7 | 4,9  | 1,5  | 0,0  | 3,1  | 25,2 | 24,8  | 93,0  |
| 2003  | 31,3                                     | 38,1 | 20,6 | 12,9 | 10,5 | 10,1 | 0,0  | 0,0  | 7,9  | 20,3 | 40,4 | 32,8  | 40,4  |
| 2004  | 32,9                                     | 54,9 | 30,9 | 22,0 | 19,2 | 7,7  | 31,9 | 0,0  | 8,0  | 13,4 | 54,0 | 57,7  | 57,7  |
| 2005  | 50,4                                     | 36,5 | 31,7 | 28,7 | 10,8 | 23,4 | 17,5 | 5,5  | 12,7 | 30,7 | 19,3 | 47,2  | 50,4  |
| 2006  | 48,3                                     | 54,4 | 21,4 | 26,5 | 27,4 | 8,1  | 2,6  | 0,0  | 1,4  | 4,5  | 28,5 | 30,9  | 54,4  |
| 2007  | 17,8                                     | 40,8 | 58,9 | 65,0 | 15,4 | 11,6 | 3,7  | 8,8  | 0,3  | 11,2 | 36,4 | 156,4 | 156,4 |
| 2008  | 42,8                                     | 37,2 | 30,4 | 16,8 | 20,4 | 3,7  | 0,0  | 2,0  | 6,3  | 53,4 | 43,4 | 22,5  | 53,4  |
| 2009  | 77,0                                     | 59,1 | 31,9 | 33,6 | 37,2 | 17,6 | 5,8  | 0,9  | 4,7  | 11,9 | 33,9 | 19,9  | 77,0  |
| 2010  | 40,6                                     | 46,2 | 39,4 | 57,1 | 43,1 | 22,2 | 10,2 | 18,3 | 34,1 | 48,0 | 46,9 | 32,7  | 57,1  |
| 2011  | 42,9                                     | 30,4 | 44,9 | 30,8 | 46,5 | 13,7 | 11,9 | 0,0  | 7,6  | 23,9 | 36,5 | 53,8  | 53,8  |
| 2012  | 62,4                                     | 56,5 | 30,3 | 23,1 | 22,9 | 15,6 | 0,0  | 0,0  | 0,8  | 15,1 | 38,2 | 31,5  | 62,4  |
| 2013  | 42,2                                     | 38,2 | 25,5 | 40,2 | 34,9 | 18,9 | 10,0 | 1,2  | 0,2  | 24,4 | 26,3 | 41,2  | 42,2  |
| 2014  | 33,9                                     | 39,5 | 29,2 | 16,2 | 13,7 | 52,4 | 6,9  | 2,1  | 0,5  | 7,7  | 25,8 | 65,4  | 65,4  |
| 2015  | 49,2                                     | 45,2 | 45,6 | 44,8 | 17,1 | 6,0  | 0,0  | 0,3  | 0,0  | 4,0  | 35,3 | 46,1  | 49,2  |
| 2016  | 20,5                                     | 55,1 | 28,3 | 25,1 | 23,5 | 47,0 | 31,0 | 17,4 | 62,6 | 60,8 | 40,8 | 36,5  | 62,6  |

## 5.2 Analisis Frekuensi

Analisis frekuensi dari data hidrologi digunakan untuk mencari hubungan antara besarnya kejadian ekstrim terhadap frekuensi kejadian dengan menggunakan distribusi probabilitas. Besarnya kejadian ekstrim mempunyai hubungan terbalik dengan probabilitas kejadian, misalnya frekuensi kejadian debit banjir besar adalah lebih kecil dibanding dengan frekuensi debit-debit sedang atau kecil. Dengan analisis frekuensi akan diperkirakan besarnya debit dengan interval kejadian seperti 10 tahunan, 100 tahunan atau 1000 tahunan dan juga berapakah frekuensi banjir dengan besar tertentu yang mungkin terjadi selama suatu periode tertentu misalnya 100 tahun.

### 5.2.1 Parameter Statistik Distribusi Normal dan Gumbel

Untuk tabel perhitungan parameter statistik dapat dilihat di lampiran. Berikut ini perhitungan parameter statistik yang dibutuhkan untuk menentukan jenis distribusi yang akan digunakan dalam perhitungan hujan rencana.

1. Nilai Rata-rata ( $\bar{x}$ )

$$\begin{aligned}\bar{x} &= \frac{1}{n} \sum_{i=1}^n x_i \\ &= \frac{1295,695}{21} \\ &= 61,7\end{aligned}$$

2. Deviasi Standar ( $s$ )

Nilai dari deviasi standar ( $s$ ) dihitung dengan persamaan 3.4. Berikut ini adalah perhitungan deviasi standar

$$\begin{aligned}s &= \sqrt{\frac{1}{21-1} \times 12104,025} \\ &= 24,008\end{aligned}$$

3. Koefisien Asimetri ( $C_s$ )

Nilai  $C_s$  dihitung dengan persamaan 3.7. Berikut ini adalah perhitungan nilai koefisien asimetri

$$\begin{aligned}C_s &= \frac{21}{(21-1)(21-2)24,008^3} \times 853235,042 \\ &= 3,408\end{aligned}$$

4. Koefisien Variasi ( $C_v$ )

Nilai  $C_v$  dihitung dengan persamaan 3.5. Berikut ini adalah perhitungan nilai koefisien variasi

$$\begin{aligned}C_v &= \frac{24,008}{61,7} \\ &= 0,389\end{aligned}$$

### 5. Koefisien Kurtois ( $C_k$ )

Nilai  $C_k$  dihitung dengan persamaan 3.8. Berikut ini adalah perhitungan nilai koefisien kurtois

$$C_k = \frac{21}{(21-1)(21-2)(21-3) \times 24,008^4} \times 81821524,593$$

$$= 15,879$$

### 5.2.2 Jenis Distribusi

Berikut ini adalah tabel parameter statistik untuk penentuan jenis distribusi.

Tabel 5. 3 Parameter Statistik Jenis Distribusi

| No | Distribusi      | Persyaratan                                    | Hasil Hitungan |
|----|-----------------|--|----------------|
| 1  | Normal          | $(\bar{x} \pm s) = 68,72 \%$                   | -              |
|    |                 | $(\bar{x} \pm 2s) = 95,44 \%$                  | -              |
|    |                 | $C_s \approx 0$                                | 3,408          |
|    |                 | $C_k \approx 3$                                | 15,879         |
| 2  | Log Normal      | $C_s = C_v^3 + 3C_v$                           | 1,226          |
|    |                 | $C_k = C_v^8 + 6C_v^6 + 15C_v^4 + 16C_v^2 + 3$ | 5,788          |
| 3  | Gumbel          | $C_s = 1,14$                                   | 3,408          |
|    |                 | $C_k = 5,4$                                    | 15,879         |
| 4  | Log Pearson III | Selain dari nilai di atas                      |                |

Dari Tabel 5.3 terlihat nilai parameter statistik hasil perhitungan tidak ada yang sesuai dengan nilai syarat parameter statistik sehingga jenis distribusi yang digunakan dalam analisis frekuensi pada penelitian ini adalah jenis distribusi Log Pearson III.

### 5.3 Hujan Rencana

Untuk mencari nilai hujan rencana beberapa kala ulang sesuai dengan distribusi Log Pearson III, maka dibutuhkan nilai-nilai parameter statistik berikut ini. Tabel Perhitungan parameter statistik untuk distribusi Log Pearson III dapat

dilihat pada lampiran. Berikut ini perhitungan nilai-nilai parameter statistik yang digunakan dalam distribusi Log Pearson III.

1. Nilai rerata dari  $\ln x_i$  ( $\bar{y}$ )

$$\begin{aligned}\bar{y} &= \frac{1}{n} \sum_{i=1}^n \ln x_i \\ &= \frac{85,534}{21} \\ &= 4,073\end{aligned}$$

2. Deviasi Standar ( $s_y$ )

$$\begin{aligned}s_y &= \sqrt{\frac{1}{n-1} \sum_{i=1}^n (\ln x_i - \ln \bar{x})^2} \\ &= \sqrt{\frac{1}{21-1} \times 1,707} \\ &= 0,285\end{aligned}$$

3. Koefisien Asimetri ( $C_{sy}$ )

$$\begin{aligned}C_{sy} &= \frac{n}{(n-1)(n-2)s_y^3} \sum_{i=1}^n (\ln x_i - \ln \bar{x})^3 \\ &= \frac{21}{(21-1)(21-2)0,2851^3} \times 0,935 \\ &= 2,229\end{aligned}$$

Nilai hujan rencana untuk beberapa periode kala ulang sesuai dengan jenis distribusi Log Pearson III dijelaskan seperti berikut ini. Nilai  $K_T$  untuk beberapa periode ulang didapatkan dari tabel nilai  $K_T$  dalam buku Hidrologi Terapan (Triatmodjo, 2008). Dari Tabel nilai  $K_T$ , nilai  $C_{sy}=2,229$  yang didapatkan berada di antara nilai  $C_{sy} = 2.2$  dan  $C_{sy} = 2.3$ , sehingga perlu dilakukan interpolasi untuk mendapatkan nilai  $K_T$  yang sesuai dengan nilai  $C_{sy}$  hasil dari perhitungan. Berikut ini adalah perhitungan interpolasi nilai  $K_T$  untuk periode ulang 2 tahun.

$$K_{T\ 2,2291} = K_{T\ 2,2} + \frac{C_{sy\ 2,2291} - C_{sy\ 2,2}}{C_{sy\ 2,3} - C_{sy\ 2,2}} \times (K_{T\ 2,3} - K_{T\ 2,2})$$

$$K_{T\ 2.2291} = -0,330 + \frac{(2,2291-2,2)}{(2,3-2,2)} \times (-0,341 - (-0,330))$$

$$= -0,333$$

Perhitungan interpolasi nilai  $K_T$  untuk periode ulang lainnya dilakukan seperti cara di atas dan hasilnya seperti dimuat dalam tabel berikut ini

Tabel 5. 4 Nilai  $K_T$  Untuk Beberapa Periode Kala Ulang Sesuai Dengan Nilai  $C_{sy}$   
Hasil Interpolasi

| $C_{sy}$ | $K_T$  |       |       |       |       |
|----------|--------|-------|-------|-------|-------|
|          | 2      | 5     | 10    | 25    | 50    |
| 2,200    | -0,330 | 0,574 | 1,284 | 2,240 | 2,970 |
| 2,300    | -0,341 | 0,555 | 1,274 | 2,248 | 2,997 |
| 2,229    | -0,333 | 0,568 | 1,281 | 2,242 | 2,978 |

Nilai hujan rencana untuk berbagai periode kala ulang dihitung dengan persamaan berikut ini.

$$y_T = \bar{y} + K_T s_y$$

$$x_T = \text{arc ln } y_T$$

Berikut ini hasil perhitungan hujan rencana untuk periode ulang 2 tahun.

$$y_{T=2 \text{ tahun}} = 4,073 + (-0,330) \times 0,2851$$

$$= 3,978$$

$$x_{T=2 \text{ tahun}} = \text{arc ln } 3,978$$

$$= 53,412$$

Hasil perhitungan hujan rencana untuk periode ulang lainnya dimuat dalam tabel berikut ini.

Tabel 5. 5 Nilai Hujan Rencana

| $T$   | $K_T$  | $Y_T$ | $X_T$   |
|-------|--------|-------|---------|
| tahun |        | mm    | mm      |
| 2     | -0,333 | 3,978 | 53,412  |
| 5     | 0,568  | 4,235 | 69,068  |
| 10    | 1,281  | 4,438 | 84,627  |
| 25    | 2,242  | 4,712 | 111,307 |

|    |       |       |         |
|----|-------|-------|---------|
| 50 | 2,978 | 4,922 | 137,274 |
|----|-------|-------|---------|

#### 5.4 Intensitas Hujan

Nilai hujan rencana yang sudah didapatkan sebelumnya merupakan nilai hujan harian sehingga perlu didistribusikan ke dalam nilai hujan jam-jaman. Sebelum didistribusikan ke dalam hujan jam-jaman, perlu dihitung nilai intensitas hujan. Intensitas hujan dihitung dengan persamaan 3.29. Durasi hujan dalam persamaan 3.29 digunakan durasi konsentrasi hujan hasil pengamatan van Breen yang terjadi di Pulau Jawa dan beberapa penelitian mengenai agihan hujan di beberapa DAS di sekitar DAS Bengawan Solo. Durasi konsentrasi hujan untuk kurva IDF dan *hyetograph* metode *ABM* diasumsikan terjadi selama 4 jam.

Di bawah ini adalah perhitungan nilai intensitas hujan untuk hujan rencana kala ulang 2 tahun dengan durasi hujan 1 jam.

$$I_t = \frac{53,412}{24} \left(\frac{24}{1}\right)^{2/3}$$

$$= 18,517 \text{ mm/jam}$$

Perhitungan untuk durasi waktu dan periode kala ulang lainnya dilakukan dengan cara yang sama, hasilnya seperti dalam tabel berikut ini.

Tabel 5. 6 Intensitas Hujan

| Durasi<br>(jam) | Intensitas Hujan Mononobe (mm/jam) |        |        |        |        |
|-----------------|------------------------------------|--------|--------|--------|--------|
|                 | Periode Ulang                      |        |        |        |        |
|                 | 2                                  | 5      | 10     | 25     | 50     |
| 1               | 18,517                             | 23,945 | 29,339 | 38,588 | 47,590 |
| 2               | 11,665                             | 15,084 | 18,482 | 24,309 | 29,980 |
| 3               | 8,902                              | 11,511 | 14,104 | 18,551 | 22,879 |
| 4               | 7,348                              | 9,502  | 11,643 | 15,314 | 18,886 |

Nilai intensitas hujan selanjutnya digambarkan dalam kurva Intensitas-Durasi-Frekuensi (IDF) di bawah ini.

Gambar 5. 2 Kurva IDF

## 5.5 Distribusi Hujan

### 5.5.1 Alternating Block Method (ABM)

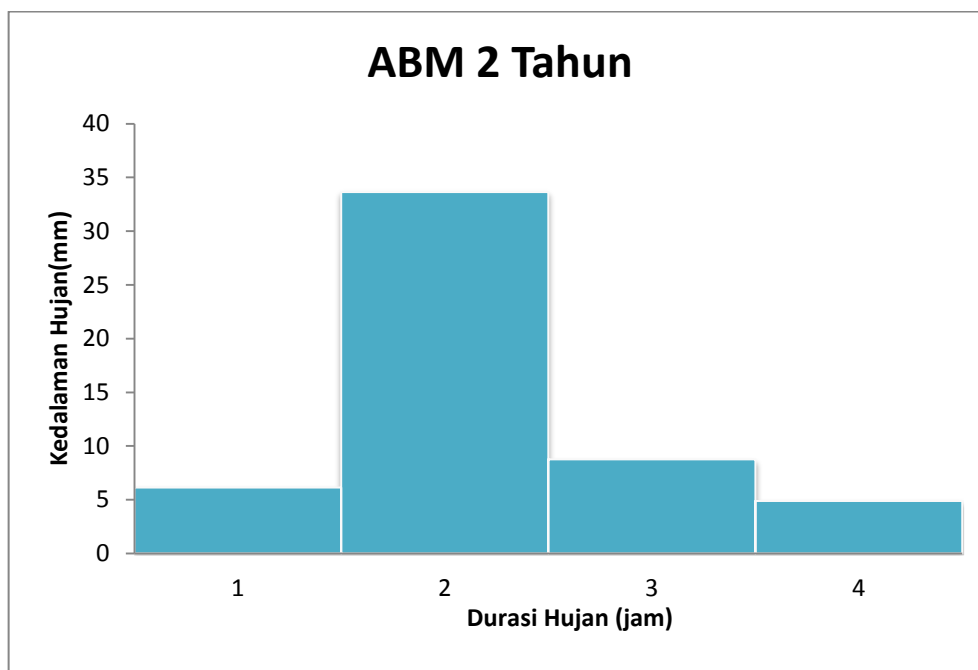

Setelah didapatkan nilai intensitas hujan, selanjutnya dihitung kedalaman hujan jam-jaman dengan menggunakan metode ABM. Berikut ini perhitungan distribusi hujan untuk kala ulang 2,5, dan 10 tahun.

#### 1. Distribusi Hujan Periode Ulang 2 Tahun

Tabel 5. 7 Hyetograph Metode ABM Periode Ulang 2 Tahun

| $T_d$<br>(jam) | $\Delta t$<br>(jam) | $I_t$<br>(jam) | $I_t T_d$<br>(mm) | $\Delta p$<br>(mm) | $pt$<br>(%) | Hyetograph<br>(%) (mm) |        |
|----------------|---------------------|----------------|-------------------|--------------------|-------------|------------------------|--------|
| 1              | 0~1                 | 18,517         | 18,517            | 18,517             | 62,996      | 11,486                 | 6,135  |
| 2              | 1~2                 | 11,665         | 23,330            | 4,813              | 16,374      | 62,996                 | 33,648 |
| 3              | 2~3                 | 8,902          | 26,706            | 3,376              | 11,486      | 16,374                 | 8,746  |
| 4              | 3~4                 | 7,348          | 29,394            | 2,688              | 9,144       | 9,144                  | 4,884  |
|                |                     |                |                   | 29,39              | 100,00      | 100,00                 | 53,412 |

Berikut ini penggambaran nilai *hyetograph* Metode *ABM* untuk hujan rencana periode ulang 2 tahun.

### 5.5.2 Tadashi Tanimoto

Distribusi hujan menurut metode Tadashi Tanimoto diberikan dalam tabel di bawah ini

Tabel 5. 10 Distribusi Hujan Tadashi Tanimoto

| Jam ke-      | 1  | 2  | 3  | 4  | 5  | 6    | 7    | 8   |
|--------------|----|----|----|----|----|------|------|-----|
| % Distribusi | 26 | 24 | 17 | 13 | 7  | 5,5  | 4    | 3,5 |
| % Kumulatif  | 26 | 50 | 67 | 80 | 87 | 92,5 | 96,5 | 100 |

Penggambaran *hyetograph* menurut metode Tadashi Tanimoto diberikan seperti di bawah ini

Gambar 5. 6 Distribusi Hujan Tadashi Tanimoto

Berikut ini hujan harian rancangan beberapa kala ulang yang akan dihitung distribusi hujannya menggunakan metode Tadashi Tanimoto.

Tabel 5. 11 Hujan Harian Rencana

| Kala Ulang<br>(Tahun) | Hujan Harian Rencana<br>(mm) |
|-----------------------|------------------------------|
| 2                     | 53,412                       |
| 5                     | 69,068                       |
| 10                    | 84,627                       |

#### 1. Kala Ulang 2 Tahun

Perhitungan kedalaman hujan untuk kala ulang 2 tahun dilakukan sebagai berikut. Contoh perhitungan untuk kedalaman hujan pada jam ke-1 diberikan sebagai berikut

$$\begin{aligned}
 \text{kedalaman hujan}_1 &= \% \text{ Distribusi}_1 \times \text{Hujan Harian 2 Tahun} \\
 &= 26 \% \times 53,412 \text{ mm} \\
 &= 13,887 \text{ mm}
 \end{aligned}$$

Untuk nilai kedalaman hujan pada jam selanjutnya dilakukan dengan cara yang sama seperti pada perhitungan di atas dan hasil perhitungannya diberikan dalam tabel 5. di bawah ini

Tabel 5. 12 Distribusi Hujan Tadashi Tanimoto Kala Ulang 2 Tahun

| Jam ke-             | 1      | 2      | 3      | 4      | 5      | 6      | 7      | 8      |
|---------------------|--------|--------|--------|--------|--------|--------|--------|--------|
| Kedalaman jam ke-   | 13,887 | 12,819 | 9,080  | 6,944  | 3,739  | 2,938  | 2,136  | 1,869  |
| Kedalaman Kumulatif | 13,887 | 26,706 | 35,786 | 42,730 | 46,469 | 49,406 | 51,543 | 53,412 |

Grafik kedalaman hujan menurut metode Tadashi Tanimoto untuk hujan rencana kala ulang 2 tahun digambarkan sebagai berikut

Gambar 5. 7 Grafik Distribusi Hujan Tadashi Tanimoto Kala Ulang 2 Tahun

## 2. Kala Ulang 5 Tahun

Perhitungan kedalaman hujan untuk kala ulang 5 tahun dilakukan sebagai berikut. Contoh perhitungan untuk kedalaman hujan pada jam ke-1 diberikan sebagai berikut

$$\text{kedalaman hujan}_1 = \% \text{ Distribusi}_1 \times \text{Hujan Harian 5 Tahun}$$

$$= 26 \% \times 69,068 \text{ mm}$$

$$= 17,958 \text{ mm}$$

Untuk nilai kedalaman hujan pada jam selanjutnya dilakukan dengan cara yang sama seperti pada perhitungan di atas dan hasil perhitungannya diberikan dalam tabel 5.13 di bawah ini

Tabel 5. 13 Distribusi Hujan Tadashi Tanimoto Kala Ulang 5 Tahun

| Jam ke-             | 1      | 2      | 3      | 4      | 5      | 6      | 7      | 8      |
|---------------------|--------|--------|--------|--------|--------|--------|--------|--------|
| Kedalaman jam ke-   | 17,958 | 16,576 | 11,742 | 8,979  | 4,835  | 3,799  | 2,763  | 2,417  |
| Kedalaman Kumulatif | 17,958 | 34,534 | 46,276 | 55,254 | 60,089 | 63,888 | 66,651 | 69,068 |

Grafik kedalaman hujan menurut metode Tadashi Tanimoto untuk hujan rencana kala ulang 5 tahun digambarkan sebagai berikut

Gambar 5. 8 Grafik Distribusi Hujan Tadashi Tanimoto Kala Ulang 5 Tahun

### 3. Kala Ulang 10 Tahun

Perhitungan kedalaman hujan untuk kala ulang 10 tahun dilakukan sebagai berikut. Contoh perhitungan untuk kedalaman hujan pada jam ke-1 diberikan sebagai berikut

$$\begin{aligned} \text{kedalaman hujan}_1 &= \% \text{ Distribusi}_1 \times \text{Hujan Harian 10 Tahun} \\ &= 26 \% \times 84,627 \text{ mm} \\ &= 22,003 \text{ mm} \end{aligned}$$

Untuk nilai kedalaman hujan pada jam selanjutnya dilakukan dengan cara yang sama seperti pada perhitungan di atas dan hasil perhitungannya diberikan dalam tabel 5.14 di bawah ini

Tabel 5. 14 Distribusi Hujan Tadashi Tanimoto Kala Ulang 10 Tahun

| Jam ke-             | 1      | 2      | 3      | 4      | 5      | 6      | 7      | 8      |
|---------------------|--------|--------|--------|--------|--------|--------|--------|--------|
| Kedalaman jam ke-   | 22,003 | 20,310 | 14,387 | 11,001 | 5,924  | 4,654  | 3,385  | 2,962  |
| Kedalaman Kumulatif | 22,003 | 42,313 | 56,700 | 67,702 | 73,625 | 78,280 | 81,665 | 84,627 |

Grafik kedalaman hujan menurut metode Tadashi Tanimoto untuk hujan rencana kala ulang 10 tahun digambarkan sebagai berikut

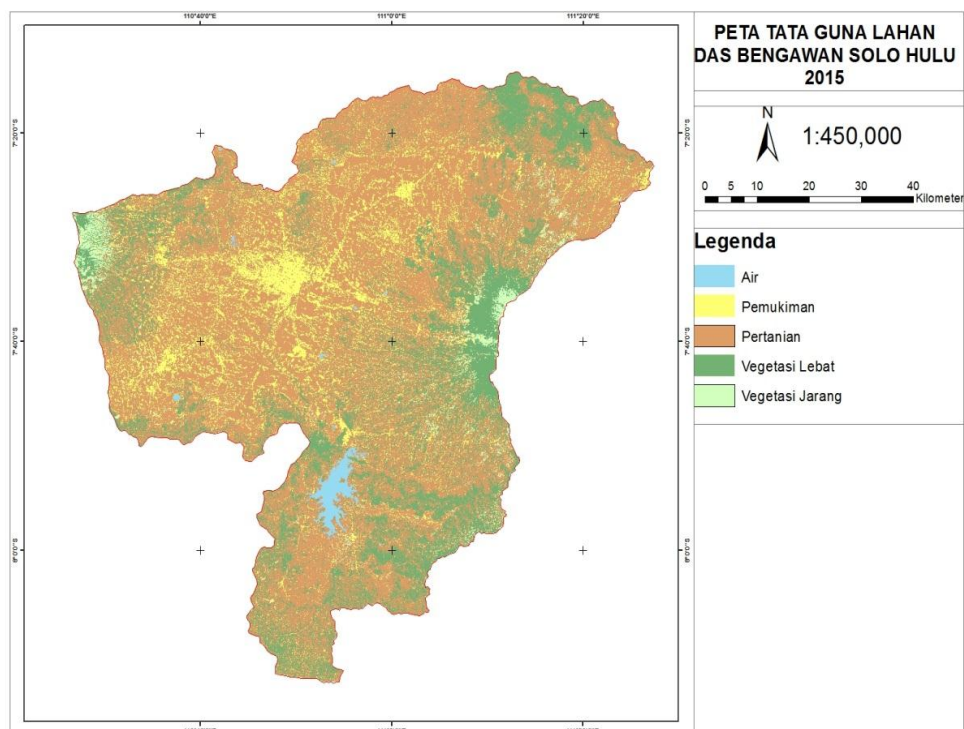

Gambar 5. 9 Grafik Distribusi Hujan Tadashi Tanimoto Kala Ulang 10 Tahun

## 5.6 Tata Guna Lahan

Analisis tata guna lahan pada DAS Bengawan Solo Hulu dilakukan menggunakan *software ArcGIS* dengan metode *Supervised Maximum Likelihood Classification*, data citra satelit yang digunakan adalah Landsat 8 tahun 2015 dan 2019 yang disediakan oleh *USGS*. Klasifikasi lahan dibagi menjadi 5 kelas, di antaranya : Air, Pemukiman, Pertanian, Vegetasi Lebat dan Vegetasi Jarang. Berikut ini adalah penjelasan hasil analisis tata guna lahan untuk peta tahun 2015 dan 2019.

### 1. Tata Guna Lahan Tahun 2015

Dibawah ini adalah peta tata guna lahan DAS Bengawan Solo Hulu Tahun 2015 hasil dari analisis menggunakan *software ArcGIS*.

Gambar 5. 10 Peta Tata Guna Lahan 2015

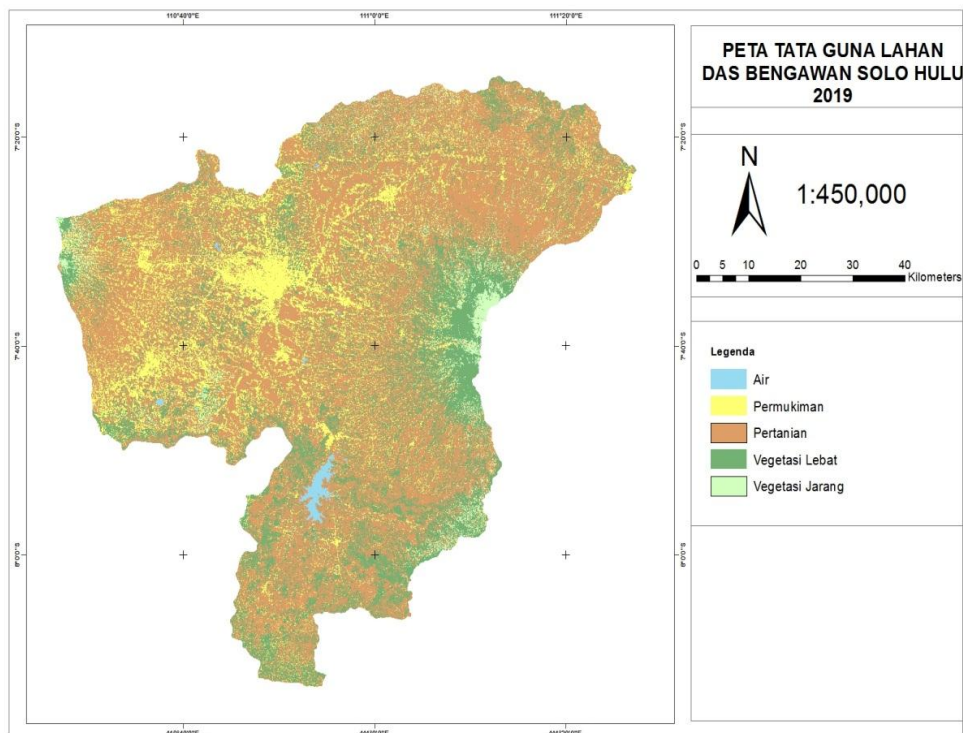

Hasil analisis tata guna lahan tahun 2015 menunjukkan bahwa penggunaan lahan didominasi oleh lahan pertanian, wilayah pemukiman paling luas berada di Kota Surakarta, sedangkan untuk jenis vegetasi lebat dan vegetasi jarang berada di Gunung Lawu, Gunung Merapi dan Gunung Merbabu, dan daerah perairan paling besar adalah Waduk Gajah Mungkur. Luas dari setiap jenis klasifikasi lahan diberikan dalam tabel 5.15 berikut ini

Tabel 5. 15 Luas Lahan Tahun 2015

| 2015            |                       |        |
|-----------------|-----------------------|--------|
| Luas Lahan      | Luas, km <sup>2</sup> | Luas % |
| Air             | 60,305                | 0,980  |
| Pemukiman       | 718,349               | 11,669 |
| Pertanian       | 3872,752              | 62,911 |
| Vegetasi Lebat  | 1342,156              | 21,803 |
| Vegetasi Jarang | 162,328               | 2,637  |
| Total           | 6155,89               | 100    |

## 2. Tata Guna Lahan Tahun 2019

Dibawah ini adalah peta tata guna lahan untuk data tahun 2019.

Gambar 5. 11 Peta Tata Guna Lahan 2019

Pada peta tata guna lahan di atas, luas setiap jenis lahan tidak banyak berubah dari hasil analisis tahun 2015, hanya ada beberapa perubahan di antaranya semakin meluasnya area pemukiman dan vegetasi, sedangkan untuk lahan pertanian sebagian berkurang sedikit karena dimanfaatkan sebagai perluasan area pemukiman, dan untuk daerah perairan pada Waduk Gajah Mungkur terlihat luas perairan yang menyusut. Luas masing-masing klasifikasi lahan diberikan dalam tabel 5.16 di bawah ini

Tabel 5. 16 Luas Lahan 2019

| 2019            |                       |        |
|-----------------|-----------------------|--------|
| Jenis Lahan     | Luas, km <sup>2</sup> | Luas % |
| Air             | 32,549                | 0,529  |
| Pemukiman       | 930,291               | 15,112 |
| Pertanian       | 3561,128              | 57,849 |
| Vegetasi Lebat  | 1411,214              | 22,925 |
| Vegetasi Jarang | 221,045               | 3,591  |

| 2019        |                       |        |
|-------------|-----------------------|--------|
| Jenis Lahan | Luas, km <sup>2</sup> | Luas % |
| Total       | 6156,226              | 100    |

### 3. Perbandingan Luas Tata Guna Lahan Tahun 2015 dan 2019

Perbandingan luas tata guna lahan tahun 2015 dan 2019 diberikan dalam tabel 5.12 dan gambar 5.13 berikut ini

Gambar 5. 12 Perbandingan Luas Tata Guna Lahan 2015 dan 2019

| Jenis Lahan     | Luas (%) |         |         |
|-----------------|----------|---------|---------|
|                 | 2015     | 2019    | Selisih |
| Air             | 0,980    | 0,529   | -0,451  |
| Pemukiman       | 11,669   | 15,111  | 3,442   |
| Pertanian       | 62,911   | 57,846  | -5,065  |
| Vegetasi Lebat  | 21,803   | 22,923  | 1,121   |
| Vegetasi Jarang | 2,637    | 3,591   | 0,954   |
| Total           | 100,000  | 100,000 |         |

Gambar 5. 13 Diagram Perbandingan Tutupan Lahan

#### 4. Tingkat Akurasi Analisis Lahan

##### a. Peta Tata Guna Lahan Tahun 2015

Akurasi analisis lahan dapat diperkirakan dengan cara membandingkan hasil analisis lahan terhadap sampel dari lahan sebenarnya. Sampel diambil sebanyak 30 titik untuk setiap jenis klasifikasi dan disebar merata pada DAS. Tabel perbandingan hasil analisis lahan terhadap sampel diberikan dalam tabel 5.17 berikut

Tabel 5. 17 Perbandingan Hasil Analisis Terhadap Sampel Tahun 2015

| Jenis Lahan        | Referensi<br>1 | Referensi<br>2 | Referensi<br>3 | Referensi<br>4 | Referensi<br>5 | Tota<br>1 |
|--------------------|----------------|----------------|----------------|----------------|----------------|-----------|
| Air                | 22             | 0              | 0              | 0              | 0              | 22        |
| Pemukiman          | 0              | 28             | 0              | 0              | 0              | 28        |
| Pertanian          | 5              | 0              | 25             | 4              | 1              | 35        |
| Vegetasi<br>Lebat  | 3              | 1              | 5              | 26             | 7              | 42        |
| Vegetasi<br>Jarang | 0              | 1              | 0              | 0              | 22             | 23        |
| Total              | 30             | 30             | 30             | 30             | 30             | 150       |

Akurasi dihitung dengan cara sebagai berikut

$$\begin{aligned}
 akurasi &= \frac{22+28+25+26+22}{150} \times 100\% \\
 &= 82\%
 \end{aligned}$$

##### b. Peta Tata Guna Lahan Tahun 2019

Berikut ini perkiraan akurasi klasifikasi lahan untuk peta tata guna lahan tahun 2019. Tabel perbandingan hasil analisis lahan terhadap sampel diberikan dalam tabel 5.18 berikut

Tabel 5. 18 Perbandingan Hasil Analisis Terhadap Sampel Tahun 2019

| Jenis Lahan       | Referensi<br>1 | Referensi<br>2 | Referensi<br>3 | Referensi<br>4 | Referensi<br>5 | Tota<br>1 |
|-------------------|----------------|----------------|----------------|----------------|----------------|-----------|
| Air               | 22             | 0              | 0              | 0              | 0              | 22        |
| Pemukiman         | 0              | 28             | 0              | 0              | 0              | 28        |
| Pertanian         | 5              | 0              | 25             | 4              | 1              | 35        |
| Vegetasi<br>Lebat | 3              | 1              | 5              | 26             | 7              | 42        |
| Vegetasi          | 0              | 1              | 0              | 0              | 22             | 23        |

| Jenis Lahan | Referensi 1 | Referensi 2 | Referensi 3 | Referensi 4 | Referensi 5 | Tota l |
|-------------|-------------|-------------|-------------|-------------|-------------|--------|
| Jarang      |             |             |             |             |             |        |
| Total       | 30          | 30          | 30          | 30          | 30          | 150    |

Akurasi dihitung dengan cara sebagai berikut

$$\begin{aligned}
 akurasi &= \frac{22+28+25+26+22}{150} \times 100\% \\
 &= 82\%
 \end{aligned}$$

#### 5. Nilai *Curve Number* (CN)

Nilai *CN* untuk setiap jenis klasifikasi lahan dipengaruhi oleh jenis tanah, oleh karena kurangnya data, maka jenis tanah digunakan jenis tanah Kelompok B.

Tabel berikut ini adalah nilai *CN* untuk masing-masing klasifikasi lahan

Tabel 5. 19 Nilai *CN*

| Jenis Lahan     | <i>CN</i> |
|-----------------|-----------|
| Pemukiman       | 85        |
| Pertanian       | 81        |
| Vegetasi Lebat  | 66        |
| Vegetasi Jarang | 79        |

### 5.7 Hujan Efektif

#### 5.7.1 Nilai *Curve Number* (CN) dan Retensi Potensial Maksimum (S)

Setelah didapatkan luasan dan nilai *Curve Number* (CN) untuk masing-masing jenis klasifikasi lahan, selanjutnya adalah menghitung nilai *CN* Komposit. Nilai *CN* Komposit digunakan untuk menghitung retensi potensial maksimum air oleh tanah (S). Hasil perhitungan nilai S akan digunakan untuk menghitung nilai kedalaaman hujan efektif ( $p_e$ ). Berikut ini perhitungan nilai *CN* Komposit dan retensi potensial maksimum (S)

#### 1. Peta Tata Guna Lahan 2015

Tabel 5. 20 Perhitungan *CN* Komposit 2015

| 2015        |          |        |    |          |
|-------------|----------|--------|----|----------|
| Jenis Lahan | Luas     | Luas % | CN | % x CN   |
| Pemukiman   | 718,349  | 11,785 | 85 | 1001,703 |
| Pertanian   | 3872,752 | 63,534 | 81 | 5146,231 |

| 2015            |          |        |    |          |
|-----------------|----------|--------|----|----------|
| Jenis Lahan     | Luas     | Luas % | CN | % x CN   |
| Vegetasi Lebat  | 1342,156 | 22,018 | 66 | 1453,220 |
| Vegetasi Jarang | 162,328  | 2,663  | 79 | 210,380  |
| Total           | 6095,585 | 100    |    | 7811,536 |

$$\begin{aligned}
 CN_{komposit} &= \frac{7811,536}{100} \\
 &= 78,115 \\
 S &= \frac{25400}{78,115} - 254 \\
 &= 71,16 \text{ mm}
 \end{aligned}$$

## 2. Peta Tata Guna Lahan 2019

Tabel 5. 21 Perhitungan CN Komposit 2019

| 2019            |          |        |    |          |
|-----------------|----------|--------|----|----------|
| Nama            | Luas     | Luas % | CN | % x CN   |
| Pemukiman       | 930,291  | 15,192 | 85 | 1291,294 |

| Total           | 6123,678 | 100    |    | 7807,869 |

$$\begin{aligned}
 CN_{komposit} &= \frac{7807,869}{100} \\
 &= 78,071 \\
 S &= \frac{25400}{78,071} - 254 \\
 &= 71,31 \text{ mm}
 \end{aligned}$$

### 5.7.2 Kedalaman Hujan Efektif

Kedalaman Hujan efektif ( $p_e$ ) merupakan nilai yang digunakan untuk perhitungan analisis debit banjir menggunakan hidrograf satuan sintetis (HSS). Berikut ini adalah perhitungan kedalaman hujan efektif

#### 1. Metode ABM

##### a. Periode Ulang 2 Tahun

Di bawah ini adalah tabel distribusi hujan ( $p$ ) untuk periode ulang 2 tahun yang akan digunakan untuk menghitung hujan efektif.

Tabel 5. 22 Distribusi Hujan Metode ABM Periode Ulang 2 Tahun

| 2 Tahun    |           |                    |
|------------|-----------|--------------------|
| <i>t</i>   | <i>p</i>  | <i>p kumulatif</i> |
| <i>jam</i> | <i>mm</i> | <i>mm</i>          |
| 1          | 6,135     | 6,135              |
| 2          | 33,648    | 39,782             |
| 3          | 8,746     | 48,528             |
| 4          | 4,884     | 53,412             |

## 1) Tahun 2015

Perhitungan kedalaman hujan efektif dilakukan dengan persamaan 3.30 berlaku untuk nilai  $p_{kum} \geq 0,2S$ . Nilai  $0,2S = 14,232$  mm, maka untuk nilai yang lebih kecil dari  $0,2S$  dianggap hujan yang jatuh meresap ke dalam tanah dan tidak menjadi limpasan permukaan. Berikut ini adalah contoh perhitungan curah hujan efektif untuk periode ulang 2 Tahun dan hasilnya diringkas dalam tabel 5.23 di bawah.

$$\begin{aligned}
 p_{e\ kum\ t=2\ jam} &= \frac{(39,782 - 0,2 \times 71,16)^2}{39,782 + 0,8 \times 71,16} \\
 &= 6,750\ mm \\
 \Delta p_e &= p_{kum\ i} - p_{kum\ i-1} \\
 &= 6,750 - 0,000 \\
 &= 6,750\ mm
 \end{aligned}$$

Tabel 5. 23 Hujan Efektif ( $\Delta p_e$ ) Metode ABM Periode Ulang 2 Tahun Untuk Data 2015

| Periode Ulang 2 Tahun |           |                    |                                |              |
|-----------------------|-----------|--------------------|--------------------------------|--------------|
| <i>t</i>              | <i>p</i>  | <i>p kumulatif</i> | <i>p<sub>e</sub> kumulatif</i> | $\Delta p_e$ |
| <i>jam</i>            | <i>mm</i> | <i>mm</i>          | <i>mm</i>                      | <i>mm</i>    |
| 1                     | 6,135     | 6,135              | 0,000                          | 0            |
| 2                     | 33,648    | 39,782             | 6,750                          | 6,750        |
| 3                     | 8,746     | 48,528             | 11,154                         | 4,403        |
| 4                     | 4,884     | 53,412             | 13,912                         | 2,759        |

## 2) Tahun 2019

Perhitungan kedalaman hujan efektif dilakukan dengan persamaan 3.30 berlaku untuk nilai  $p_{kum} \geq 0,2S$ . Nilai  $0,2S = 14,262$  mm, maka untuk nilai yang lebih kecil dari  $0,2S$  dianggap hujan yang jatuh meresap ke dalam tanah dan tidak menjadi limpasan permukaan. Berikut ini adalah contoh perhitungan curah hujan efektif untuk periode ulang 2 Tahun dan hasilnya diringkas dalam tabel 5.24 di bawah.

$$\begin{aligned}
 p_{e \text{ kum } t=2 \text{ jam}} &= \frac{(39,782 - 0,2 \times 71,31)^2}{39,782 + 0,8 \times 71,31} \\
 &= 6,726 \text{ mm} \\
 \Delta p_e &= p_{kum \ i} - p_{kum \ i-1} \\
 &= 6,726 - 0,000 \\
 &= 6,726 \text{ mm}
 \end{aligned}$$

Tabel 5. 24 Hujan Efektif ( $\Delta p_e$ ) Metode ABM Periode Ulang 2 Tahun Untuk Data 2019

| Periode Ulang 2 Tahun |        |               |                 |              |
|-----------------------|--------|---------------|-----------------|--------------|
| $t$                   | $p$    | $p$ kumulatif | $p_e$ kumulatif | $\Delta p_e$ |
| jam                   | mm     | mm            | mm              | mm           |
| 1                     | 6,135  | 6,135         | 0,000           | 0            |
| 2                     | 33,648 | 39,782        | 6,726           | 6,726        |
| 3                     | 8,746  | 48,528        | 11,121          | 4,395        |
| 4                     | 4,884  | 53,412        | 13,875          | 2,754        |

## b. Periode Ulang 5 Tahun

Di bawah ini adalah tabel kedalaman hujan ( $p$ ) untuk periode ulang 5 tahun yang akan digunakan untuk menghitung hujan efektif.

Tabel 5. 25 Distribusi Hujan Metode ABM Periode Ulang 5 Tahun

| 5 Tahun |        |               |
|---------|--------|---------------|
| $t$     | $p$    | $p$ kumulatif |
| jam     | mm     | mm            |
| 1       | 7,933  | 7,933         |
| 2       | 43,510 | 51,443        |
| 3       | 11,309 | 62,753        |
| 4       | 6,316  | 69,068        |

## 1) Tahun 2015

Perhitungan kedalaman hujan efektif dilakukan dengan persamaan 3.30 berlaku untuk nilai  $p_{kum} \geq 0,2S$ . Nilai  $0,2S = 14,232$  mm, maka untuk nilai yang lebih kecil dari  $0,2S$  dianggap hujan yang jatuh meresap ke dalam tanah dan tidak menjadi limpasan permukaan. Berikut ini adalah contoh perhitungan curah hujan efektif untuk periode ulang 5 Tahun dan hasilnya diringkas dalam tabel 5.26 di bawah.

$$\begin{aligned}
 p_{e \text{ kum } t=2 \text{ jam}} &= \frac{(51,443 - 0,2 \times 71,16)^2}{51,443 + 0,8 \times 71,16} \\
 &= 12,777 \text{ mm} \\
 \Delta p_e &= p_{kum \ i} - p_{kum \ i-1} \\
 &= 12,777 - 0,000 \\
 &= 12,777 \text{ mm}
 \end{aligned}$$

Tabel 5. 26 Hujan Efektif ( $\Delta p_e$ ) Metode ABM Periode Ulang 5 Tahun Untuk Data 2015

| Periode Ulang 5 Tahun |           |                    |                                |              |
|-----------------------|-----------|--------------------|--------------------------------|--------------|
| <i>t</i>              | <i>p</i>  | <i>p kumulatif</i> | <i>p<sub>e</sub> kumulatif</i> | $\Delta p_e$ |
| <i>jam</i>            | <i>mm</i> | <i>mm</i>          | <i>mm</i>                      | <i>mm</i>    |
| 1                     | 7,933     | 7,933              | 0,000                          | 0            |

## 2. Metode Tadashi Tanimoto

### a. Periode Ulang 2 Tahun

Di bawah ini adalah tabel distribusi hujan ( $p$ ) untuk periode ulang 2 tahun yang akan digunakan untuk menghitung hujan efektif.

Tabel 5. 31 Distribusi Hujan Metode Tadashi Tanimoto Periode Ulang 2 Tahun

| 2 Tahun |        |               |
|---------|--------|---------------|
| $t$     | $p$    | $p$ kumulatif |
| jam     | mm     | mm            |
| 1       | 13,887 | 13,887        |
| 2       | 12,819 | 26,706        |
| 3       | 9,080  | 35,786        |
| 4       | 6,944  | 42,730        |
| 5       | 3,739  | 46,469        |
| 6       | 2,938  | 49,406        |
| 7       | 2,136  | 51,543        |
| 8       | 1,869  | 53,412        |

#### 1) 2015

Perhitungan kedalaman hujan efektif dilakukan dengan persamaan 3.30 berlaku untuk nilai  $p_{kum} \geq 0,2S$ . Nilai  $0,2S = 14,232$  mm, maka untuk nilai yang lebih kecil dari  $0,2S$  dianggap hujan yang jatuh meresap ke dalam tanah dan tidak menjadi limpasan permukaan. Berikut ini adalah contoh perhitungan curah hujan efektif untuk periode ulang 2 Tahun dan hasilnya diringkas dalam tabel 5.32 di bawah.

$$p_{e \text{ kum } t=2 \text{ jam}} = \frac{(26,706 - 0,2 \times 71,16)^2}{26,706 + 0,8 \times 71,16}$$

$$= 1,860 \text{ mm}$$

$$\Delta p_e = p_{kum i} - p_{kum i-1}$$

$$= 1,860 - 0,000$$

$$= 1,860 \text{ mm}$$

| 2          | 12,819    | 26,706             | 1,860                          | 1,860        |
| 3          | 9,080     | 35,786             | 5,011                          | 3,150        |
| 4          | 6,944     | 42,730             | 8,149                          | 3,138        |
| 5          | 3,739     | 46,469             | 10,051                         | 1,901        |
| 6          | 2,938     | 49,406             | 11,635                         | 1,585        |
| 7          | 2,136     | 51,543             | 12,834                         | 1,199        |
| 8          | 1,869     | 53,412             | 13,912                         | 1,078        |

## 2) 2019

Perhitungan kedalaman hujan efektif dilakukan dengan persamaan 3.30 berlaku untuk nilai  $p_{kum} \geq 0,2S$ . Nilai  $0,2S = 14,262$  mm, maka untuk nilai yang lebih kecil dari  $0,2S$  dianggap hujan yang jatuh meresap ke dalam tanah dan tidak menjadi limpasan permukaan. Berikut ini adalah contoh perhitungan curah hujan efektif untuk periode ulang 2 Tahun dan hasilnya diringkas dalam tabel 5.33 di bawah.

$$\begin{aligned}
 p_{e \text{ kum } t=2 \text{ jam}} &= \frac{(26,706 - 0,2 \times 71,31)^2}{26,706 + 0,8 \times 71,31} \\
 &= 1,849 \text{ mm} \\
 \Delta p_e &= p_{kum i} - p_{kum i-1} \\
 &= 1,849 - 0,000 \\
 &= 1,849 \text{ mm}
 \end{aligned}$$

b. Periode Ulang 5 Tahun

Di bawah ini adalah tabel distribusi hujan (*p*) untuk periode ulang 5 tahun yang akan digunakan untuk menghitung hujan efektif.

Tabel 5. 34 Distribusi Hujan Metode Tadashi Tanimoto Periode Ulang 5 Tahun

| 5 Tahun    |           |                    |
|------------|-----------|--------------------|
| <i>t</i>   | <i>p</i>  | <i>p kumulatif</i> |
| <i>jam</i> | <i>mm</i> | <i>mm</i>          |
| 1          | 17,958    | 17,958             |
| 2          | 16,576    | 34,534             |
| 3          | 11,742    | 46,276             |
| 4          | 8,979     | 55,254             |
| 5          | 4,835     | 60,089             |
| 6          | 3,799     | 63,888             |
| 7          | 2,763     | 66,651             |
| 8          | 2,417     | 69,068             |

1) 2015

Perhitungan kedalaman hujan efektif dilakukan dengan persamaan 3.30 berlaku untuk nilai  $p_{kum} \geq 0,2S$ . Nilai  $0,2S = 14,232$  mm, maka untuk nilai yang lebih kecil dari  $0,2S$  dianggap hujan yang jatuh meresap ke dalam tanah dan tidak menjadi limpasan permukaan. Berikut ini adalah contoh perhitungan curah hujan efektif untuk periode ulang 5 Tahun dan hasilnya diringkas dalam tabel 5.35 di bawah.

$$p_{e\ kum\ t=1\ jam} = \frac{(17,958 - 0,2 \times 71,16)^2}{17,958 + 0,8 \times 71,16}$$

$$= 0,185\ mm$$

$$\Delta p_e = p_{kum\ i} - p_{kum\ i-1}$$

$$= 0,185 - 0,000$$

$$= 0,185 \text{ mm}$$

| 8          | 2,962     | 84,627             | 35,007                         | 2,197        |

2) 2019

Perhitungan kedalaman hujan efektif dilakukan dengan persamaan 3.30 berlaku untuk nilai  $p_{kum} \geq 0,2S$ . Nilai  $0,2S = 14,262$  mm, maka untuk nilai yang lebih kecil dari  $0,2S$  dianggap hujan yang jatuh meresap ke dalam tanah dan tidak menjadi limpasan permukaan. Berikut ini adalah contoh perhitungan curah hujan efektif untuk periode ulang 2 Tahun dan hasilnya diringkas dalam tabel 5.39 di bawah.

$$\begin{aligned}
 p_{e\ kum\ t=1\ jam} &= \frac{(22,003 - 0,2 \times 71,31)^2}{22,003 + 0,8 \times 71,31} \\
 &= 0,758\ mm
 \end{aligned}$$

$$\begin{aligned}
 \Delta p_e &= p_{kum\ i} - p_{kum\ i-1} \\
 &= 0,758 - 0,000 \\
 &= 0,758\ mm
 \end{aligned}$$

Tabel 5. 39 Hujan Efektif ( $\Delta p_e$ ) Periode Ulang 10 Tahun Untuk Data 2019  
Metode T. Tanimoto

| 10 Tahun |        |               |                 |              |

| 8        | 2,962  | 84,627        | 34,947          | 2,195        |

## 5.8 Hidrograf Satuan Sintetis

### 5.8.1 Hidrograf Satuan Sintetis Nakayasu

Pada bagian ini akan dilakukan analisis hidrograf satuan sintetis dengan metode Nakayasu. Data topografi dari DAS Bengawan Solo yang digunakan dalam analisis ini adalah sebagai berikut :

1. Luas DAS,  $A = 6155,90 \text{ km}^2$
2. Panjang Sungai,  $L = 150,98 \text{ km}$
3. Karakteristik DAS,  $\alpha = 2$

Berikut ini adalah analisis hidrograf satuan sintetis metode Nakayasu di DAS Bengawan Solo Hulu.

1. Waktu Kelambatan ( $t_g$ )

Waktu kelambatan (*lag time*) adalah waktu dari hujan maksimum ke puncak hidrograf atau waktu dari pusat massa hujan efektif ke pusat massa dari hidrograf (Viessman *et al.*, 1989). Waktu kelambatan dihitung dengan menggunakan persamaan 3.39. Berikut ini adalah perhitungan waktu kelambatan

$$\begin{aligned}
 t_g &= 0,4 + 0,058 \times 150,98 \\
 &= 9,157 \text{ jam}
 \end{aligned}$$

2. Satuan waktu dari curah hujan ( $T_r$ )

Satuan waktu dari curah hujan dihitung dengan persamaan 3.42. Berikut ini adalah perhitungan satuan waktu dari curah hujan

$$\begin{aligned} T_r &= 0,75 \times 9,157 \\ &= 6,868 \text{ jam} \end{aligned}$$

3. Waktu dari permulaan banjir sampai puncak hidrograf ( $T_p$ )

Waktu dari permulaan banjir sampai puncak hidrograf dihitung dengan persamaan 3.38. Berikut ini adalah perhitungan waktu dari permulaan banjir sampai puncak hidrograf

$$\begin{aligned} T_p &= 9,157 + 0,8 \times 6,868 \\ &= 14,651 \text{ jam} \end{aligned}$$

4. Waktu dari puncak banjir sampai 0,3 kali debit puncak ( $T_{0,3}$ )

Waktu dari puncak banjir sampai 0,3 kali debit puncak dihitung dengan persamaan 3.41. Berikut ini adalah perhitungan perhitungan waktu dari puncak banjir sampai 0,3 kali debit puncak

$$\begin{aligned} T_{0,3} &= 2 \times 9,157 \\ &= 18,314 \text{ jam} \end{aligned}$$

5. Debit puncak banjir ( $Q_p$ )

Debit puncak dihitung dengan persamaan 3.36. Berikut ini adalah perhitungan debit puncak banjir

$$\begin{aligned} Q_p &= \frac{1}{3,6} \left( \frac{A \times R_e}{0,3T_p + T_{0,3}} \right) \\ &= \frac{1}{3,6} \left( \frac{6155,90 \times 1}{0,3 \times 14,651 + 18,314} \right) \\ &= 75,299 \text{ m}^3/d \end{aligned}$$

Setelah didapatkan beberapa parameter hidrograf, selanjutnya dilakukan penggambaran dari bentuk hidrograf satuan sintetis metode Nakayasu dengan beberapa persamaan berikut ini.

1. Pada kurva naik ( $0 < t < T_p = 14,651$ )

Debit pada kurva naik dihitung dengan persamaan 3.43. Untuk  $t = 1 \text{ jam}$ , maka nilai  $Q_t$  adalah sebagai berikut

$$\begin{aligned} Q_1 &= 75,299 \times \left( \frac{1}{14,651} \right)^{2,4} \\ &= 0,120 \text{ m}^3/\text{d}/\text{mm} \end{aligned}$$

Perhitungan untuk durasi waktu lainnya dilakukan dengan menggunakan cara yang sama seperti di atas dan hasilnya diberikan dalam tabel berikut ini.

Tabel 5. 40 Debit Pada Kurva Naik

| $t \text{ (jam)}$ | $Q_t \text{ (m}^3/\text{d}/\text{mm)}$ |
|-------------------|--|
| 0,00              | 0,000                                  |
| 1,00              | 0,120                                  |
| 2,00              | 0,633                                  |
| 3,00              | 1,674                                  |
| 4,00              | 3,339                                  |
| 5,00              | 5,705                                  |
| 6,00              | 8,836                                  |
| 7,00              | 12,792                                 |
| 8,00              | 17,625                                 |
| 9,00              | 23,383                                 |
| 10,00             | 30,110                                 |
| 11,00             | 37,849                                 |
| 12,00             | 46,639                                 |
| 13,00             | 56,517                                 |
| 14,00             | 67,518                                 |

2. Pada kurva turun ( $T_p = 14,651 < t < T_p + T_{0,3} = 32,965$ )

Debit pada kurva turun sampai  $0,3 Q_p$  dihitung dengan persamaan 3.44.

Untuk  $t = 15 \text{ jam}$ , maka nilai  $Q_{15}$  adalah sebagai berikut

$$Q_{15} = 75,299 \times 0,3^{(15-14,651)/18,314}$$

$$= 73,591 \text{ m}^3/d$$

Perhitungan untuk durasi waktu lainnya dilakukan dengan menggunakan cara yang sama seperti di atas dan hasilnya diberikan dalam tabel berikut ini.

Tabel 5. 41 Debit Pada Kurva Turun Sampai  $0,3 Q_p$

| $t$ (jam) | $Q_t$ ( $\text{m}^3/d/mm$ ) |
|-----------|-----------------------------|
| 15,00     | 73,591                      |
| 16,00     | 68,909                      |
| 17,00     | 64,524                      |
| 18,00     | 60,419                      |
| 19,00     | 56,574                      |
| 20,00     | 52,975                      |
| 21,00     | 49,604                      |
| 22,00     | 46,448                      |
| 23,00     | 43,493                      |
| 24,00     | 40,725                      |
| 25,00     | 38,134                      |
| 26,00     | 35,708                      |
| 27,00     | 33,436                      |
| 28,00     | 31,308                      |
| 29,00     | 29,316                      |
| 30,00     | 27,451                      |
| 31,00     | 25,704                      |
| 32,00     | 24,069                      |

3. Pada kurva turun ( $T_p + T_{0,3} < t < T_p + T_{0,3} + 1,5 T_{0,3}$ )

Debit pada kurva sampai  $0,3^2 Q_p$  dihitung dengan persamaan 3.45. Untuk  $t = 33 \text{ jam}$ , maka nilai  $Q_{33}$  adalah sebagai berikut

$$Q_{33} = 75,299 \times 0,3^{[(33-14,651)+(0,5 \times 18,314)]/(1,5 \times 18,314)}$$

$$= 22,555 \text{ m}^3/d/mm$$

Perhitungan untuk durasi waktu lainnya dilakukan dengan menggunakan cara yang sama seperti di atas dan hasilnya diberikan dalam tabel berikut ini.

Tabel 5. 42 Debit Pada Kurva Turun Sampai  $0,3^2 Q_p$

| $t$ (jam) | $Q_p$ ( $m^3/d/mm$ ) |
|-----------|----------------------|
| 33,00     | 22,555               |
| 34,00     | 21,588               |
| 35,00     | 20,662               |
| 36,00     | 19,776               |
| 37,00     | 18,928               |
| 38,00     | 18,116               |
| 39,00     | 17,339               |
| 40,00     | 16,596               |
| 41,00     | 15,884               |
| 42,00     | 15,203               |
| 43,00     | 14,551               |
| 44,00     | 13,927               |
| 45,00     | 13,330               |
| 46,00     | 12,758               |
| 47,00     | 12,211               |
| 48,00     | 11,688               |
| 49,00     | 11,186               |
| 50,00     | 10,707               |
| 51,00     | 10,248               |
| 52,00     | 9,808                |
| 53,00     | 9,388                |
| 54,00     | 8,985                |
| 55,00     | 8,600                |
| 56,00     | 8,231                |
| 57,00     | 7,878                |
| 58,00     | 7,540                |
| 59,00     | 7,217                |
| 60,00     | 6,907                |

4. Pada kurva turun ( $t > T_p + T_{0,3} + 1,5T_{0,3}$ )

Pada kurva turun sampai mendekati 0 dihitung dengan persamaan

3.46. Untuk  $t = 61 \text{ jam}$ , maka nilai  $Q_{61}$  adalah sebagai berikut

$$\begin{aligned} Q_{61} &= 75,299 \times 0,3^{[(61-14,651)+(1,5 \times 18,314)]/(2 \times 18,314)} \\ &= 6,652 \text{ m}^3/\text{d}/\text{mm} \end{aligned}$$

Perhitungan untuk durasi waktu lainnya dilakukan dengan menggunakan cara yang sama seperti di atas dan hasilnya diberikan dalam tabel berikut ini.

Tabel 5. 43 Debit Pada Kurva Turun Sampai  $Q \sim 0$

| $t \text{ (jam)}$ | $Q_t \text{ (m}^3/\text{d}/\text{mm)}$ |
|-------------------|--|
| 61,00             | 6,652                                  |
| 62,00             | 6,437                                  |

Selanjutnya dilakukan penggambaran bentuk hidrograf satuan sintetis metode Nakayasu dari nilai debit yang diperoleh dari perhitungan sebelumnya. Berikut ini adalah bentuk hidrograf satuan sintetis dari metode Nakayasu.

Gambar 5. 14 Hidrograf Sintetis Metode Nakayasu

Langkah berikutnya, nilai-nilai debit ( $Q$ ) di atas perlu diperiksa apakah memang benar disebabkan oleh hujan efektif sebesar 1 mm. Nilai kedalaman

hujan yang disebabkan oleh debit limpasan ( $Q$ ) di atas dicari dengan cara total volume limpasan dibagi dengan luas DAS. Contoh perhitungan untuk volume limpasan antara  $t=0$  jam dan  $t=1$  jam adalah sebagai berikut

$$\begin{aligned} V &= (0 + 0,120) \times (1 - 0) \times 0,5 \times 60 \times 60 \\ &= 215,768 \text{ m}^3 \end{aligned}$$

Perhitungan untuk interval waktu lainnya menggunakan cara yang sama seperti contoh perhitungan di atas. Total volume limpasan yang didapatkan dari perhitungan adalah 6.024.962,723 m<sup>3</sup>. Luas total DAS adalah 6155,89 km<sup>2</sup>, sehingga nilai dari kedalaman hujan didapatkan sebesar 0,978 mm. Nilai  $Q$  pada hidrograf perlu dikoreksi dengan mengalikan faktor koreksi,  $f=1/0,978$  terhadap nilai  $Q$ . Hasil lengkap perhitungan volume limpasan awal dan koreksi diberikan dalam tabel 5.44 di bawah ini

Tabel 5. 44 Nilai  $Q$  dan  $V$  Awal dan Koreksi dari HSS Nakayasu

| t (jam) | $Q_t$ (m <sup>3</sup> /d) | V Awal (m <sup>3</sup> ) | $Q_t$ Koreksi (m <sup>3</sup> /d) | V Koreksi (m <sup>3</sup> ) |

### 5.8.2 Hidrograf Satuan Sintetis SCS (*Soil Conservation Service*)

Berikut ini perhitungan hidrograf satuan sintetis dengan menggunakan metode Hidrograf Satuan Sintetis SCS.

1. Waktu Konsentrasi ( $t_c$ )

Waktu konsentrasi dihitung dengan rumus

$$\begin{aligned} t_c &= 26,85 \times L^{0,841} \\ &= 26,85 \times 150,98^{0,841} \\ &= 1825,64 \text{ menit} \\ &= 30,43 \text{ jam} \end{aligned}$$

2. Waktu kelambatan ( $t_p$ )

Nilai waktu kelambatan dihitung dengan persamaan

$$\begin{aligned} t_p &= 0,6 \times t_c \\ &= 0,6 \times 30,43 \text{ jam} \\ &= 18,26 \text{ jam} \end{aligned}$$

3. Waktu puncak ( $T_p$ )

Nilai waktu puncak hidrograf dihitung dengan persamaan

$$\begin{aligned} T_p &= \frac{t_r}{2} + t_p \\ &= \frac{6,868}{2} + 18,26 \\ &= 21,7 \text{ jam} \end{aligned}$$

4. Debit puncak ( $q_p$ )

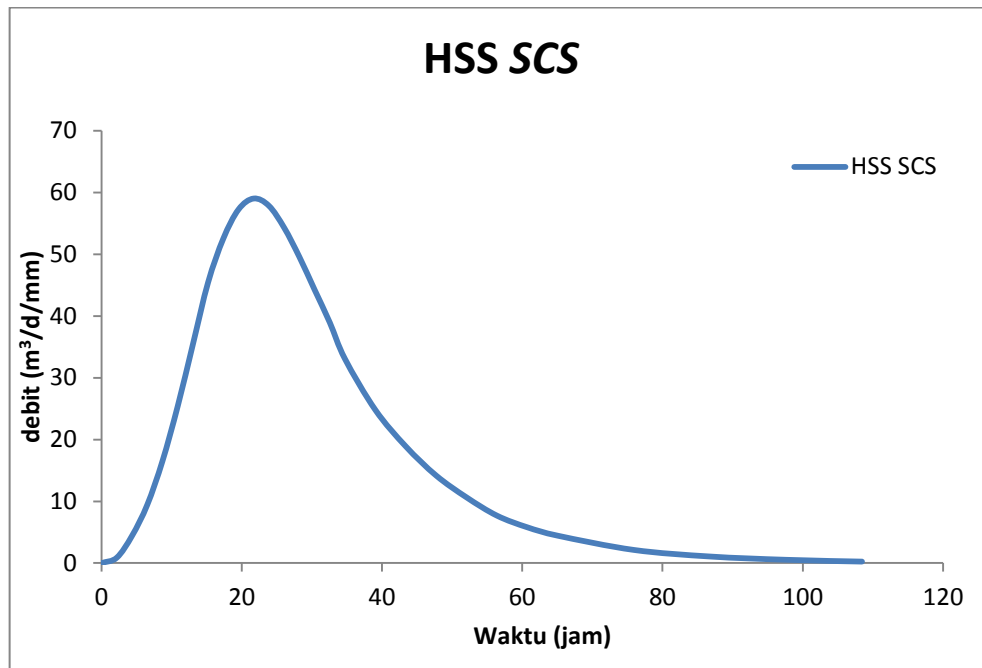

$$\begin{aligned} q_p &= 0,208 \times \frac{A}{T_p} \\ &= 59,03 \text{ m}^3/\text{d}/\text{mm} \end{aligned}$$

Bentuk HSS SCS diperoleh dari nilai  $t/T_p$  dan  $q/q_p$  yang telah ditetapkan oleh SCS. Nilai  $t$  adalah perkalian antara  $t/T_p$  dan  $T_p$  sedangkan nilai  $q$  adalah perkalian antara  $q/q_p$  dan  $q_p$  hasil perhitungan sebelumnya. Berikut ini adalah tabel hasil perhitungan nilai  $t$  dan  $q$  dari HSS SCS.

Tabel 5. 45 Nilai t dan q

| $t/T_p$ | $t$ (jam) | $q/q_p$ | $q$ ( $m^3/d/mm$ ) |
|---------|-----------|---------|--------------------|
| 0       | 0,000     | 0       | 0,000              |
| 0,1     | 2,169     | 0,015   | 0,885              |
| 0,2     | 4,338     | 0,075   | 4,427              |
| 0,3     | 6,507     | 0,16    | 9,445              |

Bentuk dari Hidrograf Satuan Sintetis *Soil Conservation Service* (SCS) digambarkan sebagai berikut

Gambar 5. 17 Hidrograf Satuan Sintetis SCS

Pada tabel 5.15 di atas nilai  $t$  tidak beraturan, maka perlu dibuat nilai  $\Delta t=1$  jam, sehingga nilai  $q$  perlu dilakukan interpolasi sesuai nilai  $t$  yang baru. Berikut perhitungan untuk mendapatkan nilai  $q$  pada  $t = 1$  jam.

$$\begin{aligned}
 q_1 &= q_0 + \frac{(t_1 - t_0)}{(t_2 - t_0)} \times (q_2 - q_0) \\
 &= 0 + \left( \frac{1-0}{2,169-0} \right) \times (0,885 - 0) \\
 &= 0,408 \text{ m}^3/\text{d}/\text{mm}
 \end{aligned}$$

Perhitungan untuk mendapatkan nilai  $q$  pada nilai  $t$  lainnya dilakukan dengan cara yang sama seperti perhitungan di atas dan hasilnya dapat dilihat pada tabel berikut

Tabel 5. 46 Nilai debit ( $q$ )

| $t$ (jam) | $q$ (m <sup>3</sup> /d/mm) |
|-----------|----------------------------|
| 0         | 0,000                      |
| 1         | 0,408                      |
| 2         | 0,816                      |
| 3         | 2,242                      |
| 4         | 3,875                      |

| $t$ (jam) | $q$ ( $m^3/d/mm$ ) |
|-----------|--------------------|
| 5         | 5,959              |
| 6         | 8,272              |

Bentuk dari Hidrograf Satuan Sintetis *Soil Conservation Service (SCS)* hasil interpolasi digambarkan sebagai berikut

Gambar 5. 18 Hidrograf Satuan Sintetis SCS Interpolasi

Selanjutnya, nilai-nilai debit ( $q$ ) di atas perlu diperiksa apakah memang benar disebabkan oleh hujan efektif sebesar 1 mm. Nilai kedalaman hujan yang disebabkan oleh debit ( $q$ ) di atas dicari dengan cara total volume limpasan dibagi dengan luas DAS. Contoh perhitungan untuk volume limpasan antara  $t=0$  jam dan  $t=1$  jam adalah sebagai berikut

$$\begin{aligned} V &= (0 + 0,408) \times (1 - 0) \times 0,5 \times 60 \times 60 \\ &= 734,835 \text{ m}^3 \end{aligned}$$

Perhitungan untuk interval waktu lainnya menggunakan cara yang sama seperti contoh perhitungan di atas. Total volume limpasan yang didapatkan dari perhitungan adalah 6.244.122,083 m<sup>3</sup>. Luas total DAS adalah 6155,89 km<sup>2</sup>, sehingga nilai dari kedalaman hujan didapatkan sebesar 1,014 mm. Nilai  $q$  pada hidrograf perlu dikoreksi dengan mengalikan faktor koreksi,  $f=1/1,014$  terhadap nilai  $q$ . Hasil lengkap perhitungan volume limpasan awal dan koreksi diberikan dalam tabel 5.47 di bawah ini

Tabel 5. 47 Nilai dari q dan V Awal dan Koreksi dari HSS SCS

| $t$ (jam) | $q$ ( $m^3/d$ ) | $V$ ( $m^3$ ) | $q$ koreksi ( $m^3/d$ ) | $V$ koreksi ( $m^3/d$ ) |

## 5.9 Analisis Debit Banjir

### 5.9.1 Perhitungan *Baseflow*

Berikut ini adalah peta jaringan sungai dari DAS Bengawan Solo Hulu yang didapatkan dari situs Ina-Geoportal.

Gambar 5. 22 Peta Jaringan Sungai DAS Bengawan Solo Hulu

Perhitungan nilai *baseflow* dilakukan dengan persamaan 3.35 dari rumus yang ada dalam HSS GAMA 1. Hasil analisis pada DAS Bengawan Solo Hulu diketahui panjang sungai semua tingkat,  $LN = 8646,17$  km dan luas DAS,  $A = 6159$  km<sup>2</sup>, sehingga dapat dihitung kerapatan jaringan kuras ( $D$ ) dan nilai baseflownya ( $Q_b$ ). Di bawah ini adalah perhitungan nilai  $D$  dan  $Q_b$

$$\begin{aligned}
 D &= \frac{LN}{A} \\
 &= \frac{8646,17}{6159} \\
 &= 1,403 \\
 Q_b &= 0,4715 \times 6159^{0,6444} \times 1,403^{0,9430} \\
 &= 179,622 \text{ m}^3/\text{detik}
 \end{aligned}$$

### 5.9.2 Perhitungan Debit Banjir Metode HSS Nakayasu

Perhitungan debit banjir Metode HSS Nakayasu dilakukan dengan cara sebagai berikut

#### 1. Distribusi Hujan *Alternating Block Method (ABM)*

##### a. Periode Ulang 2 Tahun

##### 1) Tahun 2015

Nilai debit banjir untuk tahun 2015 periode ulang 2 Tahun dengan menggunakan HSS Nakayasu dan distribusi hujan *ABM* dimuat dalam tabel 5.48 berikut. Pada tabel di bawah ini, nilai debit *surface runoff*  $Q_1=0$ , kondisi tersebut terjadi karena nilai kedalaman hujan pada jam ke-1 lebih kecil daripada nilai *initial abstraction* ( $I_a$ ), sehingga nilai hujan efektif  $P_e=0$ . Keadaan serupa berlaku untuk perhitungan debit banjir lain di dalam penelitian ini.

Tabel 5. 48 Debit Banjir Metode HSS Nakayasu Periode Ulang 2 Tahun Data 2015 (ABM)

## 2) Tahun 2019

Nilai debit banjir untuk tahun 2019 periode ulang 2 Tahun dengan menggunakan HSS Nakayasu dan distribusi hujan Tadashi Tanimoto dimuat dalam tabel 5.55 berikut

Tabel 5. 55 Debit Banjir Metode HSS Nakayasu Periode Ulang 2 Tahun Data 2019 (T.Tanimoto)

| Metode Nakayasu       |                                       |                               |                               |                               |                               |                               |                               |                               |                               |                               |                               |

Grafik perbandingan nilai debit banjir HSS SCS tahun 2015 dan 2019 untuk periode ulang 2 tahun digambarkan sebagai berikut

Gambar 5. 26 Grafik Perbandingan Debit Banjir HSS Nakayasu Tahun 2015 dan 2019 Kala Ulang 2 Tahun (T.Tanimoto)

## b. Periode Ulang 5 Tahun

## 1) Tahun 2015

Nilai debit banjir untuk tahun 2015 periode ulang 5 Tahun dengan menggunakan HSS Nakayasu dan distribusi hujan Tadashi Tanimoto dimuat dalam tabel 5.56 berikut

Tabel 5. 56 Debit Banjir Metode HSS Nakayasu Periode Ulang 5 Tahun Data 2015

Grafik perbandingan nilai debit banjir HSS Nakayasu tahun 2015 dan 2019 untuk periode ulang 10 tahun digambarkan sebagai berikut

Gambar 5. 28 Grafik Perbandingan Debit Banjir HSS Nakayasu Tahun 2015 dan 2019 Periode Ulang 10 Tahun (T.Tanimoto)

### 5.9.3 Perhitungan Debit Banjir Metode HSS *Soil Conservation Service (SCS)*

Perhitungan debit banjir Metode HSS *SCS* dilakukan dengan cara sebagai berikut

#### 1. Distribusi Hujan *Alternating Block Method (ABM)*

##### a. Periode Ulang 2 Tahun

##### 1) Tahun 2015

Nilai debit banjir untuk tahun 2015 periode ulang 2 Tahun dengan menggunakan HSS *SCS* dan distribusi hujan *ABM* dimuat dalam tabel 5.60 berikut

Tabel 5. 60 Debit Banjir Metode HSS *SCS* Periode Ulang 2 Tahun Data 2015 (*ABM*)

Grafik perbandingan nilai debit banjir metode HSS Nakayasu tahun 2015 dan 2019 untuk periode ulang 2 tahun digambarkan sebagai berikut

Gambar 5. 29 Grafik Perbandingan Debit Banjir HSS SCS Tahun 2015 dan 2019 Periode Ulang 2 Tahun (ABM)

## b. Periode Ulang 5 Tahun

## 1) Tahun 2015

Nilai debit banjir untuk tahun 2015 periode ulang 5 Tahun dengan menggunakan HSS SCS dan distribusi hujan ABM dimuat dalam tabel 5.62 berikut

Tabel 5. 62 Debit Banjir Metode HSS SCS Periode Ulang 5 Tahun Data 2015 (ABM)

### 5.10 Pembahasan

Perhitungan parameter statistik terhadap data curah hujan harian menunjukkan kecenderungan penggunaan jenis distribusi probabilitas Log Pearson III untuk melakukan analisis frekuensi. Curah hujan harian dengan kala ulang 2, 5, dan 10 tahun yang dihasilkan dari analisis frekuensi jenis distribusi probabilitas Log Pearson III berturut-turut sebesar 53,412 mm, 69,068 mm, dan 84,627 mm.

Analisis mengenai perubahan tata guna lahan pada DAS Bengawan Solo Hulu antara tahun 2015 sampai tahun 2019 menunjukkan adanya beberapa perubahan dalam tata guna lahan yang ada. Pada DAS Bengawan Solo Hulu untuk kawasan pemukiman terjadi perluasan sebesar 3,4 %, kawasan pertanian mengalami penyempitan sekitar 5,3 % dan kawasan vegetasi mengalami perluasan sekitar 2 %. Perubahan yang terjadi tersebut dapat mempengaruhi proses meresapnya air hujan ke dalam tanah. Hasil dari analisis *Curve Number (CN)* untuk tahun 2015 dan tahun 2019 menunjukkan adanya perubahan nilai *Curve Number* akibat pola tata guna lahan terjadi. Untuk tahun 2015 didapatkan nilai CN sebesar 78,115, sedangkan untuk tahun 2019 didapatkan nilai CN sebesar 78,079. Nilai CN terlihat mengalami penurunan sebesar 0,036, hal itu sesuai karena adanya perubahan tata guna lahan yang terjadi. Walaupun terjadi perubahan tata guna lahan dari kawasan pertanian menjadi kawasan pemukiman, hal itu tidak terlalu berpengaruh karena perbedaan nilai *CN* antara kawasan pemukiman dan pertanian tidak terlalu besar. Sebaliknya perubahan kawasan pertanian menjadi daerah vegetasi cukup mempengaruhi terhadap penurunan nilai *CN* karena perbedaan yang cukup jauh antara nilai *CN* kawasan pertanian dan daerah vegetasi. Penurunan nilai *CN* secara keseluruhan sangat kecil antara tahun 2015 sampai tahun 2019 sehingga penyerapan air hujan ke dalam tanah tidak terlalu berubah.

Pada perhitungan debit banjir digunakan dua metode yaitu Metode Nakayasu dan Metode *Soil Conservation Service (SCS)* serta dua jenis distribusi hujan yaitu *Alternating Block Method (ABM)* dan Tadashi Tanimoto. Maksud dari penggunaan metode perhitungan debit banjir dan jenis distribusi hujan yang berbeda adalah sebagai pembandingan terhadap terhadap hasil yang diperoleh dari

masing-masing metode. Pada bab tinjauan pustaka terlihat metode perhitungan debit banjir cenderung menggunakan metode SCS sehingga perlu digunakan metode lain selain yang ada dalam tinjauan pustaka seperti Metode Nakayasu.

Hasil analisis debit banjir dengan metode HSS Nakayasu dan HSS *Soil Conservation Service (SCS)* menunjukkan adanya perubahan nilai debit banjir walaupun sangat kecil. Debit banjir pada tahun 2019 menunjukkan adanya penurunan dibandingkan dengan debit banjir pada tahun 2015. Hal itu sesuai dengan teori yang ada, yaitu jika nilai *CN* suatu kawasan semakin kecil maka debit banjir yang terjadi juga akan semakin kecil.

Penggunaan metode Nakayasu dan metode SCS dalam perhitungan debit banjir memberikan nilai debit yang berbeda. Metode Nakayasu memberikan nilai debit yang lebih tinggi daripada metode SCS dengan selisih yang cukup besar. Jenis distribusi hujan yang berbeda tidak terlalu mempengaruhi nilai debit banjir untuk metode SCS sedangkan pada metode Nakayasu penggunaan jenis distribusi hujan yang berbeda cukup mempengaruhi nilai debit banjir yang dihasilkan.

## **BAB VI**

### **KESIMPULAN DAN SARAN**

#### **6.1 Kesimpulan**

Pada penelitian yang telah dilakukan, daerah aliran sungai (DAS) Bengawan Solo Hulu mengalami beberapa perubahan dalam pola tata guna lahan selama tahun 2015-2019. Area pemukiman dan vegetasi terlihat semakin luas sedangkan untuk area pertanian mengalami penyempitan. Analisis citra satelit *Landsat* menunjukkan konversi area pertanian menjadi area pemukiman merupakan faktor utama terkait perubahan tata guna lahan sedangkan perluasan area vegetasi yang tidak terlalu besar tampak terlihat jelas untuk kawasan hutan lindung di DAS Bengawan Solo. Perubahan pola tata guna lahan dari area pertanian menjadi area pemukiman dapat meningkatkan besarnya aliran permukaan, tetapi peningkatannya tidak terlalu besar karena kemampuan permukaan tanah dalam meresapkan air hujan yang jatuh pada area pertanian dan pemukiman tidak berbeda jauh. Sebaliknya perluasan area vegetasi walaupun kecil terlihat dapat mengurangi besarnya aliran permukaan, hal itu karena kemampuan area vegetasi dalam meresapkan air hujan yang jatuh sangat baik dibandingkan area pertanian.

Debit banjir di DAS Bengawan Solo Hulu antara tahun 2015-2019 mengalami sedikit penurunan akibat dari adanya perubahan tata guna lahan. Besarnya penurunan debit sangat kecil yaitu berkisar  $2 \text{ m}^3/\text{detik}$  sampai  $5 \text{ m}^3/\text{detik}$  dan hal itu tidak mempengaruhi ketinggian air di sungai utama DAS Bengawan Solo Hulu.

#### **6.2 Saran**

Pada penelitian yang telah dilakukan, penulis merasa masih banyak kekurangan yang perlu dilengkapi sehingga penelitian serupa di masa yang akan datang dapat melengkapinya. Beberapa hal seperti analisis tata guna lahan dan perhitungan debit banjir masih dapat dikembangkan di masa yang akan datang dan penggunaan beberapa metode yang berbeda dapat dilakukan. Metode analisis

terhadap pola tata guna lahan dapat dilakukan dengan selain metode *maximum likelihood classification* pada *software* ArcGIS dan aplikasi perangkat lunak yang lainnya. Perhitungan debit banjir juga dapat dilakukan dengan metode lain seperti Hidrograf Satuan Sintetis (HSS) GAMA 1, HSS ITB 1, HSS ITB 2, dan lain-lain ataupun menggunakan pemodelan seperti dalam tinjauan pustaka seperti *WetSpa*, *HEC-HMS*, dan *SWAT*.
