

BAB IV

ANALISIS DISAIN BALOK KOMPOSIT

4.1. Pendahuluan

Pada bab ini dibahas mengenai batasan analisis, contoh hitungan analisis disain dengan metode ASD dan LRFD, pemrograman komputer yang meliputi *flowchart* dan program komputer dengan bahasa BASIC. Adapun pemrograman komputer yang digunakan dalam menganalisis balok komposit dengan menggunakan metode ASD AISC dan LRFD AISC ini bertujuan untuk mempermudah dalam mendapatkan hasil disain balok komposit yang efisien. Jika analisis dilakukan dengan cara manual akan memerlukan ketelitian dan waktu yang sangat lama, karena sampel variabel yang cukup banyak.

4.2. Batasan Analisis Disain

Dalam analisis disain balok komposit ini diperlukan batasan-batasan yang lebih spesifik agar bisa diperoleh hasil yang sesuai dengan tujuan penulisan. Adapun batasan-batasan tersebut antara lain :

- ~ Mutu baja $F_y = F_{yr} = 36$ Ksi
- ~ Variasi mutu beton (f'_c) = 3.0, 3.5, 4.0, 4.5 dan 5.0 Ksi
- ~ $\gamma_b = 2320$ kg/m³ (berat beton normal)
- ~ Jarak antar balok yang bersebelahan (b_0) = 2.5, 3.0, 3.5, 4.0 dan 4.5 m

~ Pemilihan profil dilakukan dengan cara trial and error dan dipilih mulai profil W yang terkecil sampai pada profil yang aman jika didisain oleh kedua metode. Adapun pemilihan profilnya mulai dari W10 sampai W40.

~ Beban mati setelah beton mengeras (q_{dc}) hanya meliputi :

- Berat penggantung dan langit-langit = 18 kg/m^2

- Tegel (3 cm) = $3 \times 24 = 72 \text{ kg/m}^2$

- Spesi (2 cm) = $2 \times 21 = 42 \text{ kg/m}^2$

- Pasir (5 cm) = $5 \times 16 = 80 \text{ kg/m}^2$

- Finishing (2 cm) = $2 \times 24 = 48 \text{ kg/m}^2$

= 250 kg/m^2

~ Tebal *slab* dicari dengan menggunakan rumus SK-SNI 1991:

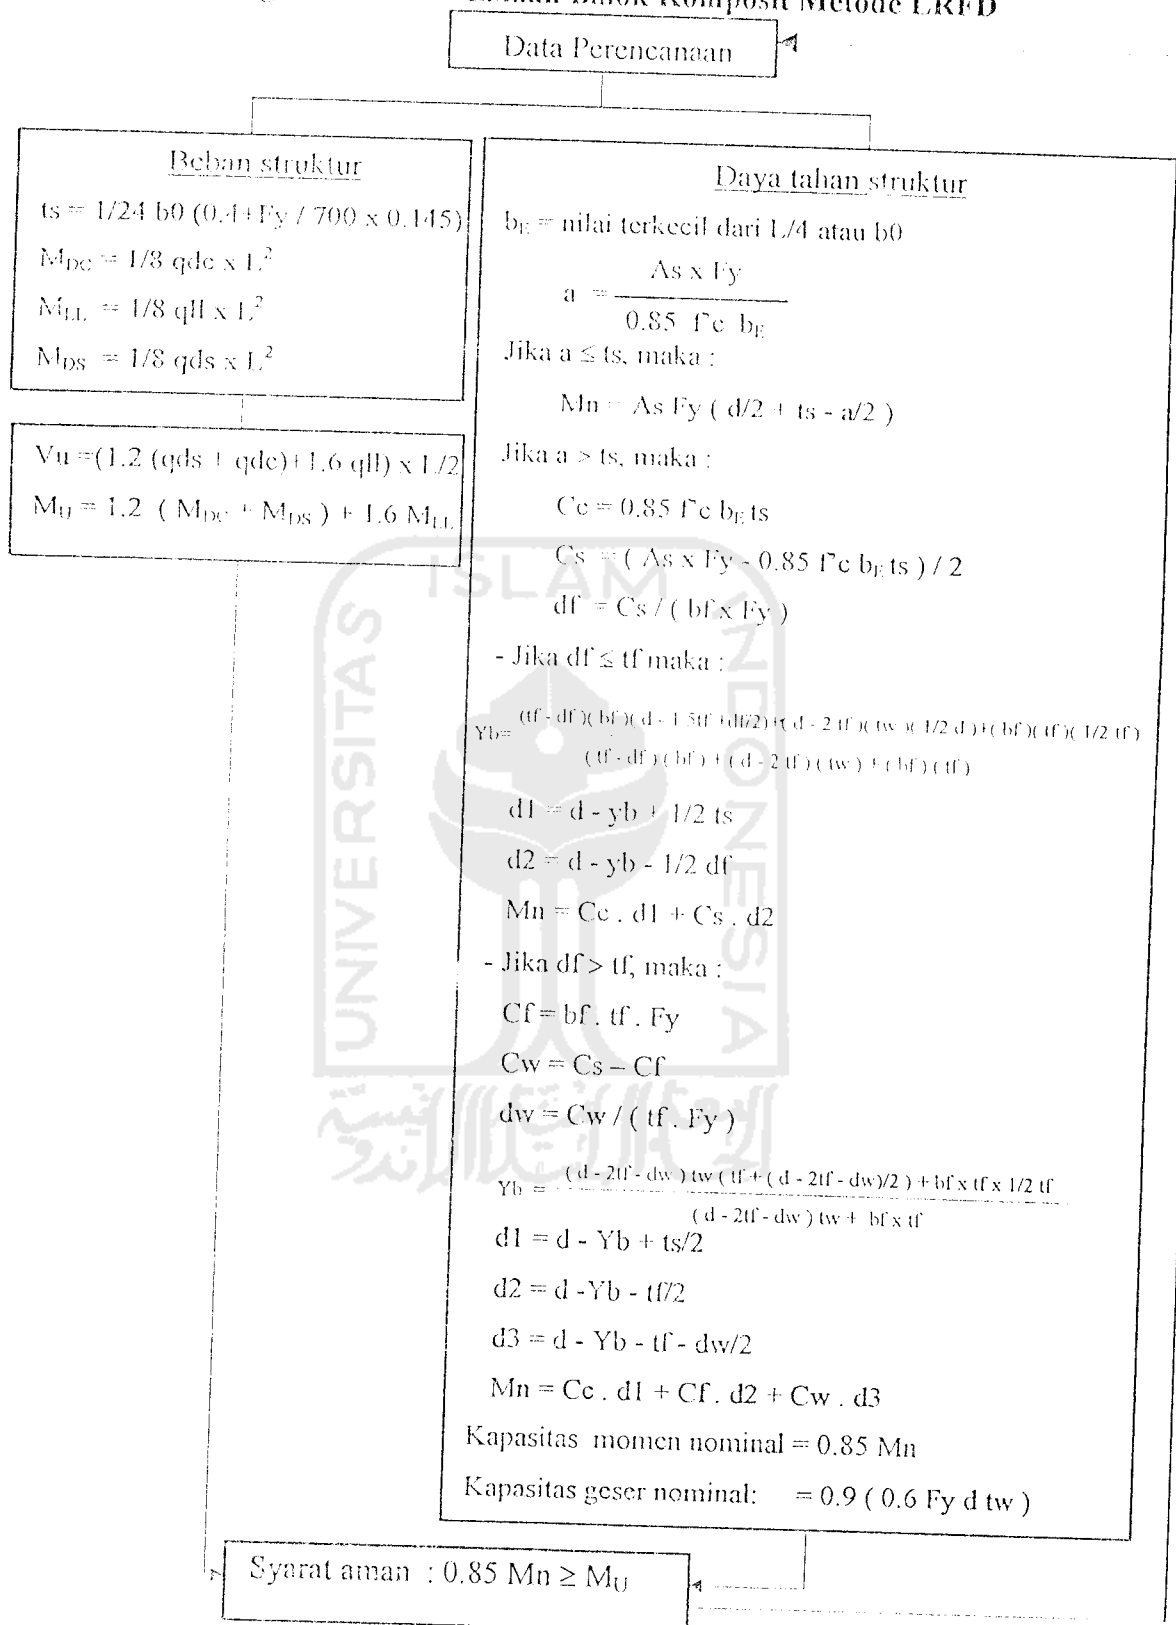

$$1/24 \times b_0 \left(4 + \frac{F_y}{700 \times 145} \right)$$

~ Variabel panjang bentang antara 8 s/d 24 m dengan kelipatan 2 (8 m, 10 m, 12 m, 14 m, 16 m, 18 m, 20 m, 24 m).

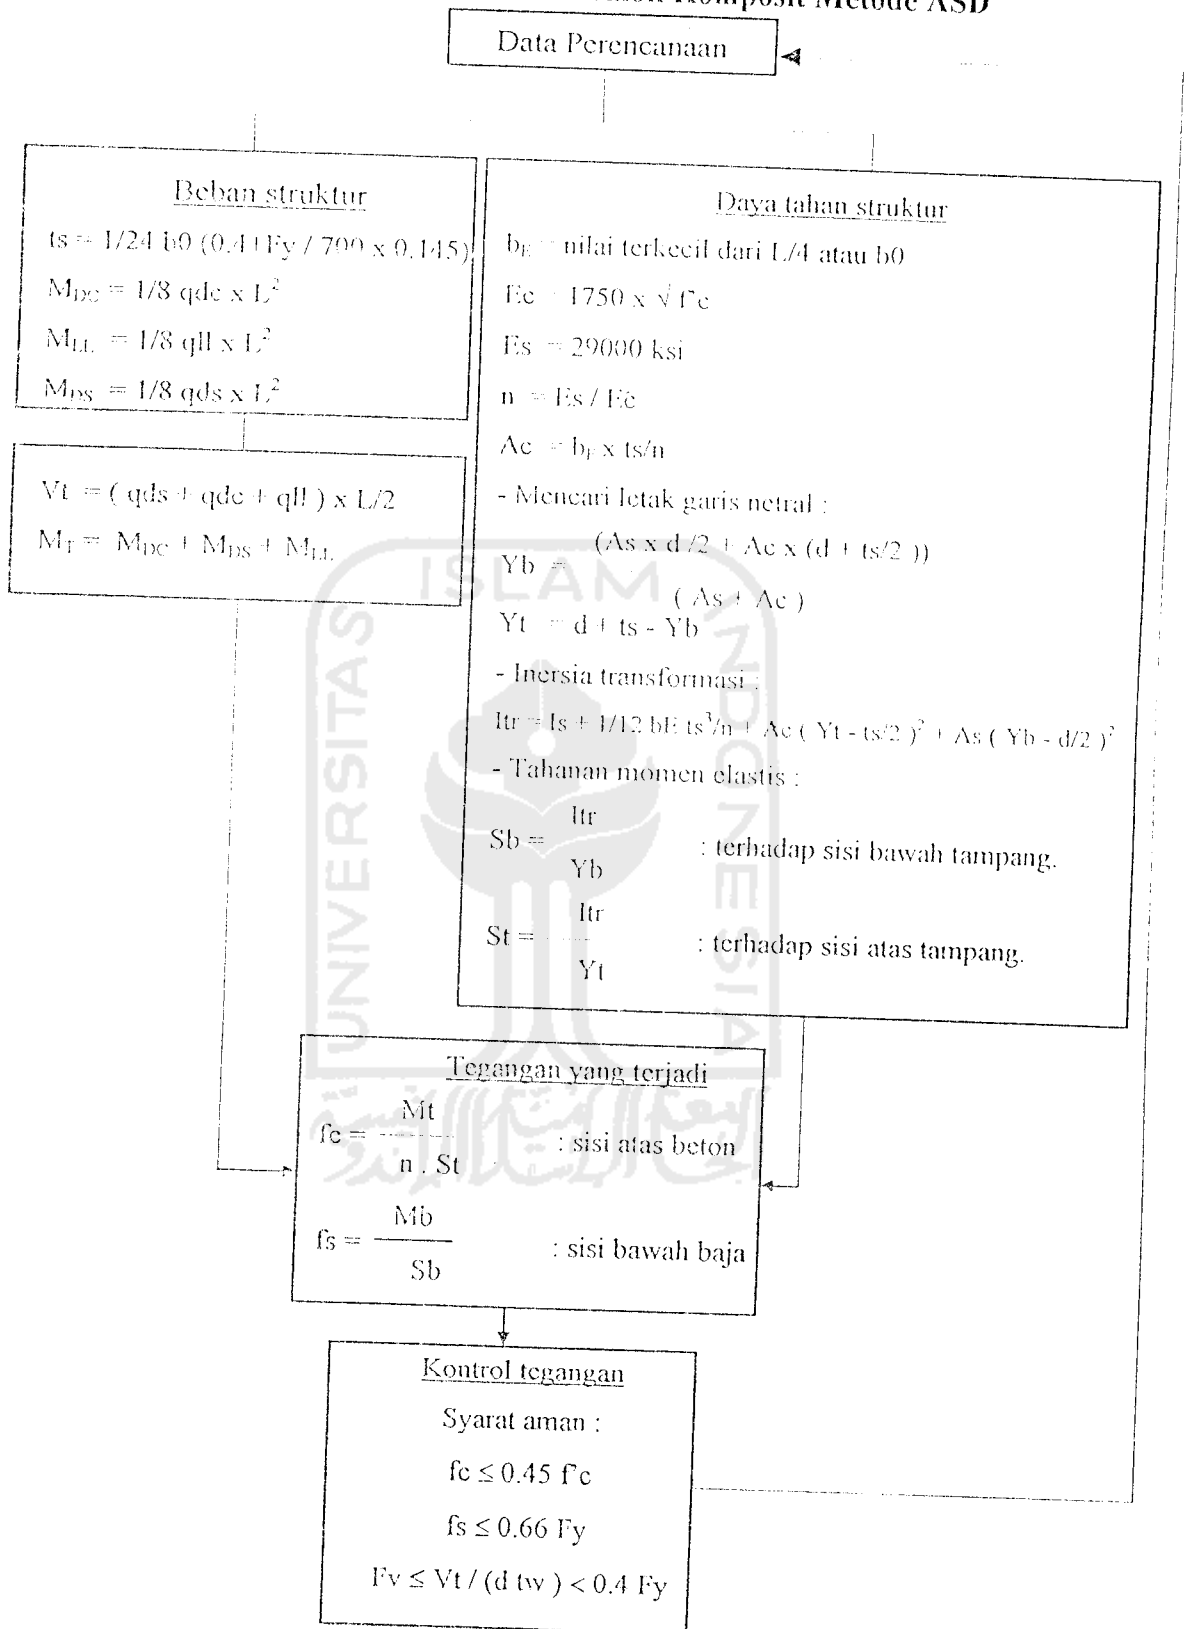

Didalam analisis pemakaian variable panjang bentang (l), jarak antar balok (b_0) dan mutu beton (f_c) dilakukan dengan cara bergantian. Jika digunakan variabel panjang bentang berubah maka untuk variabel jarak antar balok (b_0) dan mutu beton (f_c) tetap, jika jarak antar balok berubah maka variabel panjang bentang (l) dan mutu beton tetap dan jika variabel mutu beton berubah maka panjang bentang (l) dan jarak antar balok (b_0) tetap.

Berikut ini untuk mempermudah dalam menganalisis maka dibuat bagan alir yang merupakan proses perencanaan balok komposit.

Bagan Alir Perencanaan Balok Komposit Metode LRFD

Bagan Alir Perencanaan Balok Komposit Metode ASD

4.3. Analisis Disain Balok Komposit

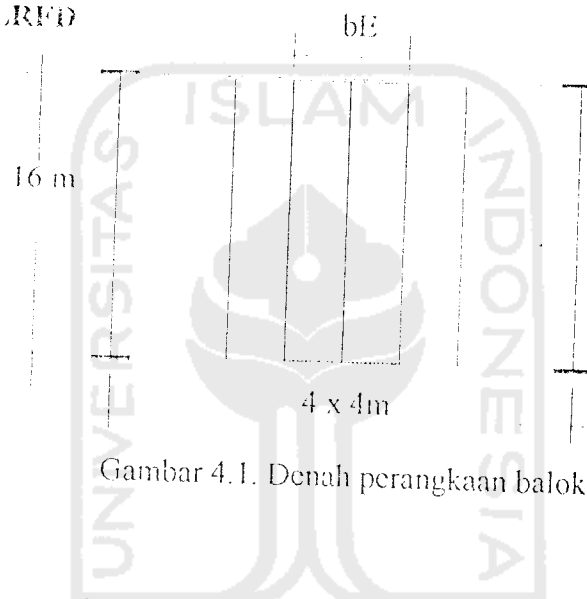

Rancanglah suatu balok komposit interior untuk lantai yang di rencanakan untuk perpustakaan seperti terlihat pada gambar 4.1. Jika balok dirancang menggunakan perancah atau penyangga sementara (*shoring*).

Gunakan $F_y = F_{yr} = 36$ Ksi; $F_c = 3.5$ Ksi; $\gamma_b = 2320$ kg/cm³; $b_0 = 4$ m; $L = 16$ m.

Rencanakan dengan metode : a. LRFD

b. ASD

a. Metode LRFD

Gambar 4.1. Denah perangkaan balok

Penyelesaian:

$$\begin{aligned} \gamma_b &= 2320 \text{ kg/m}^3 \\ &= 2320 \times 3.6127 \cdot 10^{-8} = 8.381 \cdot 10^{-6} \text{ k/in}^3 \end{aligned}$$

$$L = 16 \text{ m} = 16 / 0.0254 = 629.9213 \text{ in}$$

$$b_0 = 4 \text{ m} = 4 / 0.0254 = 157.480 \text{ in}$$

$$s_b = 1/24 \cdot b_0 (0.4 + F_y / (700 \times 0.145))$$

$$= 1/24 \times 4 \times (0.4 + 36 / (700 \times 0.145))$$

$$= 0.12577997 \text{ m} = 12.57997 \text{ cm} \approx 13 \text{ cm} \approx 4.1181 \text{ in}$$

a. Hitungan pembebanan

* Beban mati sebelum beton mengeras (q_{ds})

$$\sim \text{Berat slab beton} = (0.13)(2320)(4) = 1113.6 \text{ kg/m}$$

\sim Berat profil yang digunakan

* Beban mati setelah beton mengeras (q_{dc}) = 250 kg/m²

$$\sim q_{dc} = 250 \times 4 = 1000 \text{ kg/m}$$

* Beban hidup setelah beton mengeras (q_{ll}) = 400 kg/m²

$$\sim \text{Beban hidup perpustakaan} = 400 \times 4 = 1600 \text{ kg/m}$$

- Dicoba dengan profil W12 x 152

Data-data profil:

$$- A_s = 44.7 \text{ in}^2 \quad - b_f = 12.48 \text{ in} \quad - I_x = 1430 \text{ in}^4$$

$$= 3.7677 \text{ ksi} < 0.4 F_y = 0.4 \times 36 = 14.4 \text{ ksi (OKE)}$$

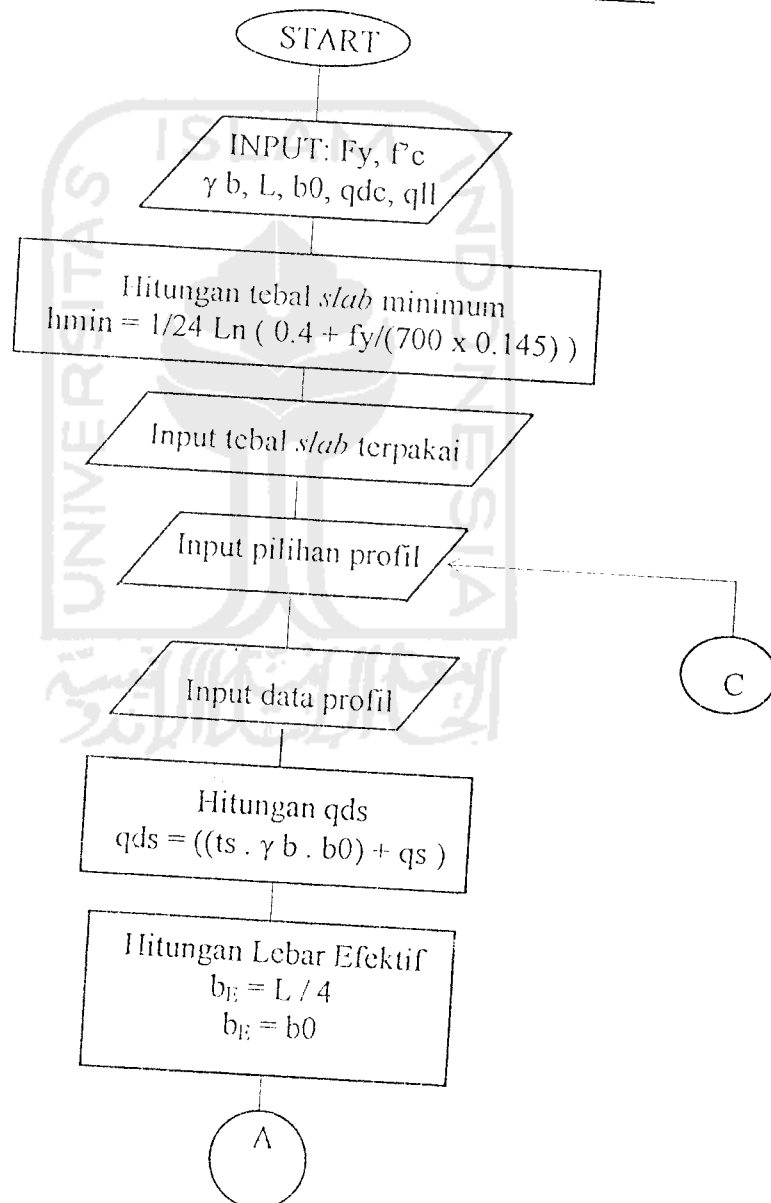

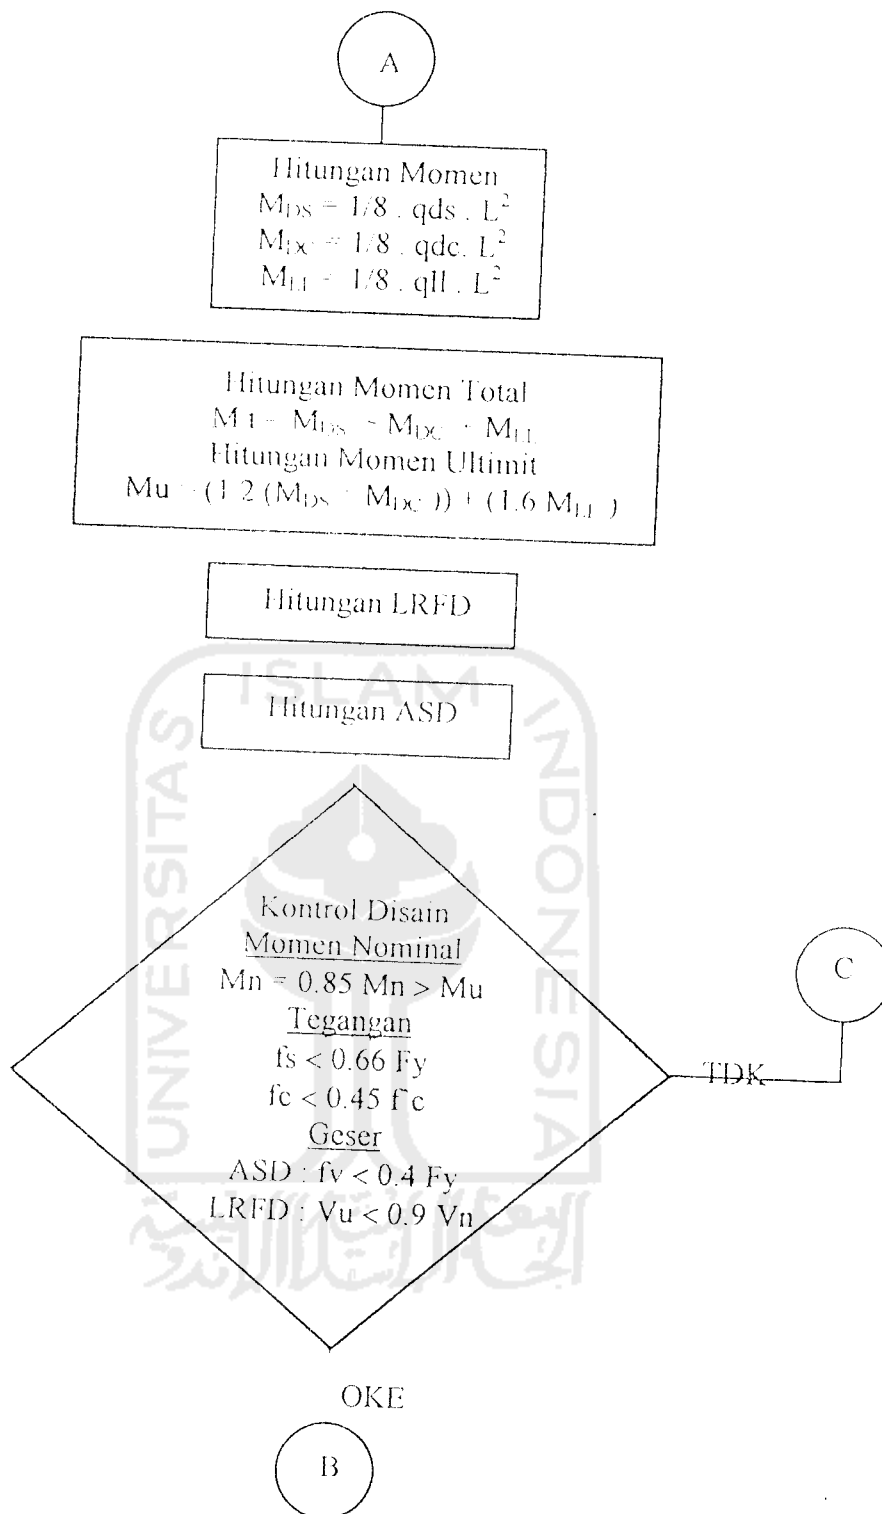

4.4. Bagan Alir (*Flowchart*)

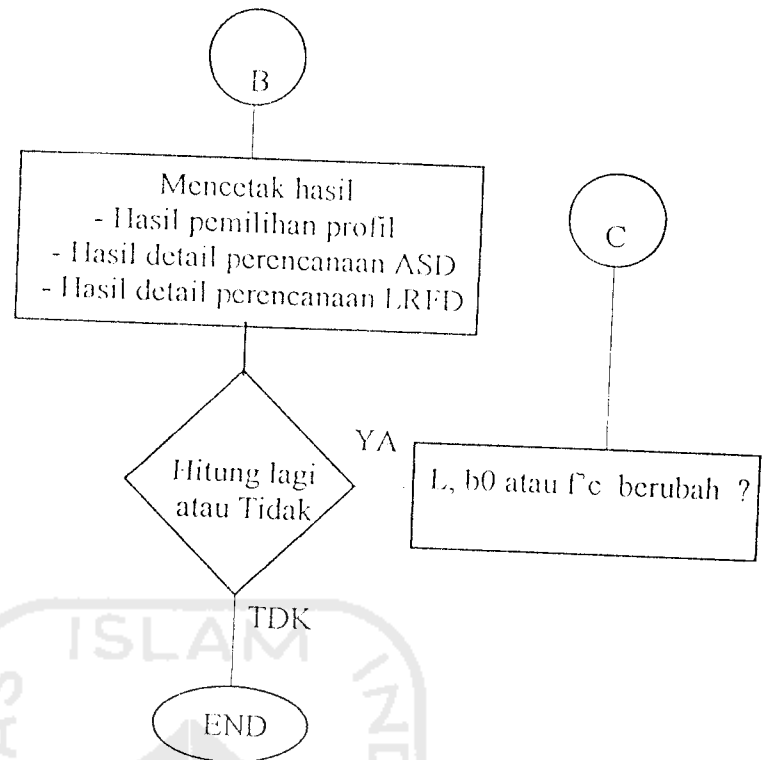

Bagan alir ini dibuat untuk memudahkan dalam pembuatan program dan juga memudahkan dalam melihat tahap-tahap penyelesaian atau tahap eksekusi program. Bagan alir ini memuat analisis komparasi analisis disain balok komposit dengan metode ASD AISC dan LRFD AISC.

Untuk lebih jelasnya dapat dilihat di bawah ini :

FLOWCHART DISAIN BALOK KOMPOSIT

Dalam pemilihan profil yang paling efisien terlebih dahulu dilakukan analisis disain dengan mencoba beberapa profil yang aman digunakan. Pemilihan profil yang paling efisien berarti efisien dari segi berat profil, karena semakin ringan suatu profil maka dari segi biaya akan semakin murah. Dengan biaya yang murah dan keamanan yang terjamin, maka syarat-syarat perencanaan sudah terpenuhi. Dengan adanya hal tersebut, maka setelah diadakan beberapa kali analisis dengan mencoba beberapa profil, dapat ditentukan profil yang paling efisien.
