## SARI

Sepakbola adalah salah satu cabang olahraga paling populer di dunia. Berkat kepopulerannya tersebut, banyak *game* bertemakan sepakbola bermunculan. Salah satu dari *game* tersebut adalah Fantasy Premier League (FPL). Game ini sudah memiliki lisensi resmi dari The FA (*Football Association*).

Fantasy Premier League adalah sebuah game strategi yang memungkinkan pemainnya, dalam hal ini disebut sebagai manajer, untuk membangun tim impian mereka. Tim ini terdiri dari 15 pemain yang berasal dari berbagai klub yang berlaga di Liga Premier Inggris. 15 Pemain tersebut terbagi menjadi empat kategori posisi, masing-masing dua penjaga gawang, lima pemain bertahan, lima pemain tengah, dan tiga pemain depan. Kemudian manajer kembali menyeleksi 15 pemain tersebut untuk membentuk sebuah *starting eleven* seperti sepakbola pada umumnya.

Setiap manajer Fantasy Premier League diberikan kebebasan dalam memilih pemain dan formasi setiap pekannya. Akan tetapi dari 9 juta lebih manajer Fantasy Premier League, sebagian besar dari mereka mengandalkan *feeling* dan *sentiment* dalam memilih pemain, hanya beberapa persen yang menggunakan data statistik sebagai acuan. Oleh karena itu akan dibuat sebuah sistem yang akan membantu manajer dalam pemilihan pemain dengan menggunakan statistik dan *track record* pemain. Sistem ini akan menggunakan metode SAW dalam pengaplikasianya. Hasil dari penelitian ini adalah rekomendasi pemain yang layak dijadikan pilihan untuk membentuk sebuah tim dalam *game* Fantasy Premier League.

Kata kunci: sepakbola, *game*, Fantasy Premier League, FPL, sistem pendukung keputusan, SAW.

### PENDAHULUAN

#### 1.1 Latar Belakang

Sepakbola merupakan salah satu cabang olahraga paling populer di dunia (Iskandar et al., 2020). Hal ini dapat dilihat melalui data jumlah pengikut di Instagram. Dilansir dari [kompas.com](https://www.kompas.com), sebanyak dua dari lima besar jumlah pengikut Instagram terbanyak di dunia adalah seorang atlit sepakbola, masing-masing Cristiano Ronaldo berada di peringkat kedua dengan 451 juta pengikut dan Lionel Messi di peringkat keempat dengan 335 juta pengikut (8 Juni 2022). Begitupun dengan jumlah penonton langsung, sepakbola memegang rekor jumlah penonton terbanyak dalam dunia olahraga, pada pertandingan Final Piala Dunia 1950 antara Brasil melawan Uruguay dengan jumlah penonton mencapai 199.854 orang (Nurzahputra et al., 2017).

Sepakbola adalah sebuah pertandingan antar tim yang masing-masing tim berjumlah 11 orang. Tujuan utama dalam bermain sepakbola adalah mencetak angka sebanyak mungkin ke gawang lawan dan mempertahankan gawang agar tidak kebobolan oleh lawan (Iskandar et al., 2020). Bermain sepakbola bukan hanya mengandalkan fisik semata, tapi juga menggunakan strategi agar dapat memenangkan pertandingan. Salah satu pemain terbaik versi situs [fifpro.com](https://www.fifpro.com), Andrea Pirlo pernah mengatakan, “Sepakbola dimainkan dengan otak, kaki anda hanya sebagai alat”. Seiring dengan berjalananya waktu, permainan sepakbola semakin hari semakin berkembang. Banyak strategi-strategi baru yang muncul untuk memenangkan sebuah pertandingan, seperti *Tiki-taka*, *Gegen-Pressing*, *Bus Parking*, *Kick ‘n Rush*, *Total Football*, dan lain-lain .

Kepopuleran sepakbola ini memunculkan ide untuk membuat *game* sepakbola. Ada banyak game populer yang mengambil tema sepakbola, seperti EA FIFA, PES, dan Winning Eleven. Pada *game* tersebut pemain berperan sebagai otak dominator untuk melakukan serangan dan pertahanan. Dengan kata lain pemain berkontribusi langsung dalam permainan tersebut. Selain itu ada juga game yang menawarkan pemain untuk menjadi pelatih dalam sebuah tim sepakbola, diantaranya Football Manager, Top Eleven, dan Fantasy Premier League. Pada *game* ini pemain tidak turut ambil bagian dalam permainan di lapangan, melainkan menyusun strategi yang akan digunakan dalam pertandingan.

Fantasy Premier League adalah sebuah *game* strategi yang dapat dilihat dari situs resminya [fantasy.premierleague.com](https://fantasy.premierleague.com), telah dimainkan oleh lebih dari 9 juta pemain. Gim ini memungkinkan seseorang untuk memilih 15 pemain dari berbagai klub yang berlaga di pentas Premier League. Dari 15 pemain yang dipilih terbagi menjadi 4 kategori posisi, masing-masing 2 penjaga gawang (*goalkeeper*), 5 pemain bertahan (*defender*), 5 pemain tengah (*midfielder*), dan 3 pemain depan (*striker*). Kemudian dari 15 pemain tersebut akan diseleksi kembali untuk menentukan siapa pemain yang akan menjadi *starting eleven* seperti permainan sepakbola pada umumnya (Bonello et al., 2019).

Game Fantasy Premier League adalah sebuah game yang sangat mengedepankan taktik. Strategi dan kecerdikan pemain, atau dalam hal ini pelatih, akan sangat penting dalam menyusun kombinasi pemain yang akan menjadi *starting eleven* agar dapat memperoleh hasil yang maksimal (Nurzahputra et al., 2017). Akan tetapi, hanya sedikit dari mereka yang melakukan pemilihan pemain menggunakan stastistik, sebagian besar manajer hanya menggunakan *feeling* dan *sentiment* mereka (Bhatt et al., 2019). Oleh karena itu akan dibuat sebuah sistem yang dapat membantu manajer dalam menentukan pemilihan pemain pada game Fantasy Premier League.

Sistem ini akan menggunakan metode *Simple Additive Weight* (SAW) dalam pengaplikasiannya. Metode SAW digunakan untuk membuat sebuah Sistem Pendukung Keputusan karena tingkat akurasi yang tinggi, fleksibel, serta dapat digunakan untuk perhitungan yang kompleks (Windarto, 2017). SAW atau biasa disebut metode penjumlahan terbobot adalah sebuah metode yang mencari penjumlahan terbobot dari rating kinerja pada setiap alternatif pada semua atribut. Metode SAW membutuhkan proses normalisasi matriks keputusan (X) ke suatu skala yang dapat diperbandingkan dengan semua rating alternatif yang ada (Nurrahmi & Misbahuddin, 2019). Metode ini digunakan karena dapat menentukan nilai bobot dari setiap alternatif, kemudian melakukan perankingan untuk memberikan rekomendasi terbaik dari semua alternatif berdasarkan kriteria dan bobot tertentu (Muqorobin et al., 2019).

### LANDASAN TEORI

#### 2.1 Fantasy Premier League (FPL)

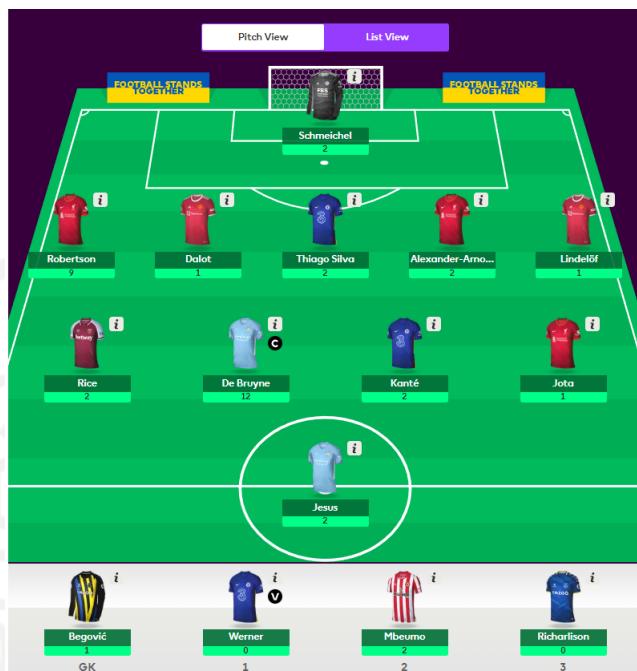

Gambar 2.1 Halaman Utama Fantasy Premier League

Fantasy Premier League adalah sebuah *game* strategi bertemakan sepakbola. Gim ini memungkinkan manajer untuk memilih 15 pemain dari berbagai klub yang berlaga di pentas Premier League. Dari 15 pemain yang dipilih terbagi menjadi 4 kategori posisi, masing-masing 2 penjaga gawang (*goalkeeper*), 5 pemain bertahan (*defender*), 5 pemain tengah (*midfielder*), dan 3 pemain depan (*striker*). Manajer akan diberikan modal awal berupa *in-game currency* sebesar £100. Total harga dari 15 pemain yang terpilih tidak boleh melebihi *currency* yang diberikan.

Gambar 2.2 Tim dalam Fantasy Premier League

Kemudian dari 15 pemain tersebut akan diseleksi kembali untuk menentukan siapa pemain yang akan menjadi *starting eleven* seperti permainan sepakbola pada umumnya.

Gambar 2.3 *Starting Eleven* dan Pemain Cadangan

Setiap pelatih diberikan kebebasan dalam menentukan formasi dengan aturan jumlah penjaga gawang maksimal satu orang dan jumlah pemain di lapangan termasuk penjaga gawang maksimal 11 orang. Strategi dan kecerdikan pelatih, akan sangat penting dalam menyusun kombinasi pemain yang akan menjadi *starting eleven* agar dapat memperoleh poin yang maksimal (Nurzahputra et al., 2017). Perolehan poin pada Fantasy Premier League dapat dilihat pada Tabel 2.1.

## 2.2 Sistem Pendukung Keputusan

### 2.2.1 Pengertian Sistem Pendukung Keputusan

Sistem Pendukung Keputusan atau *Decision Support System* adalah sebuah sistem yang memanfaatkan teknologi komputer untuk membantu manusia dalam mengambil sebuah keputusan agar mendapatkan keuntungan atau benefit yang diinginkan (Khoiriyah et al., 2019). Sistem Pendukung keputusan bukanlah sebuah sistem yang mahabesar dan mutlak, melainkan hanya sebagai media untuk merekomendasikan sebuah pilihan dengan memberikan hasil kalkulasi dari data yang dimiliki untuk dijadikan acuan dalam mengambil sebuah keputusan.

Terdapat banyak metode populer yang biasa digunakan dalam membuat Sistem Pendukung Keputusan, seperti *Simple Additive Weight* (SAW), *Analytical Hierarchy Process* (AHP), *Technology for Order Performance by Similarity to Ideal Solution* (TOPSIS), dan *Profile Matching* (PM). Pada penelitian ini akan digunakan metode *Simple Additive Weight* (SAW) dalam perhitungannya.

### 2.2.2 Komponen Sistem Pendukung Keputusan

Secara umum terdapat tiga komponen utama dalam sebuah sistem pendukung keputusan yang akan dijabarkan sebagai berikut (Khoiriyah et al., 2019):

- a. Data merupakan sebuah komponen penting dalam sebuah Sistem Pendukung Keputusan. Data yang dimiliki akan disimpan dalam *database* kemudian akan diolah untuk menghasilkan informasi yang bisa dibaca dan berguna untuk mengambil sebuah keputusan.
- b. *Model base* atau suatu model yang dapat mepresentasikan permasalahan kedalam format kuantitatif (seperti pemodelan matematika) sebagai dasar pengambilan keputusan. Termasuk di dalamnya objektif atau tujuan dari permasalahan, komponen terkait constraints atau batasan, dan hal terkait lain. *Model base* memungkinkan pengguna menganalisa alternatif secara utuh melalui pengembangan dan pembandingan. (Eka Larasati, 2019)

- c. GUI (*Graphical User Interface*) adalah kombinasi dari kedua komponen di atas yang berfungsi sebagai antarmuka yang dapat menghubungkan pengguna dengan data dan model dalam sebuah sistem pendukung keputusan.

## 2.3 Metode Sistem Pendukung Keputusan

### 2.3.1 Metode SAW

Metode *Simple Additive Weight* (SAW) merupakan salah satu metode populer dalam Sistem Pendukung Keputusan. Metode SAW banyak digunakan untuk membuat sebuah Sistem Pendukung Keputusan karena tingkat akurasi yang tinggi, fleksibel, serta dapat digunakan untuk perhitungan yang kompleks (Windarto, 2017).

SAW atau biasa disebut metode penjumlahan terbobot adalah sebuah metode yang mencari penjumlahan terbobot dari rating kinerja pada setiap alternatif pada semua atribut. Metode SAW membutuhkan proses normalisasi matriks keputusan (X) ke suatu skala yang dapat diperbandingkan dengan semua rating alternatif yang ada. Metode ini digunakan karena dapat menentukan nilai bobot dari setiap alternatif, kemudian melakukan perankingan untuk memberikan rekomendasi terbaik dari semua alternatif berdasarkan kriteria dan bobot tertentu (Muqorobin et al., 2019).

### 2.3.2 Metode TOPSIS

Metode TOPSIS atau *Technology for Order Performance by Similarity to Ideal Solution* adalah salah satu metode populer dalam sistem pendukung keputusan. Metode ini diperkenalkan oleh Yoon dan Hwang. Metode TOPSIS memiliki prinsip bahwa alternatif terpilih harus mempunyai jarak terdekat dari solusi ideal positif dan jarak terjauh dari solusi ideal negatif dari sudut pandang geometris dengan menggunakan jarak Euclidean (jarak antara dua titik) untuk menentukan kedekatan relatif dari suatu alternatif dengan solusi optimal (Pramudhita et al., 2015).

### 2.3.3 Metode AHP

Metode *Analytical Hierarchy Process* (AHP) adalah sebuah metode sistem pendukung keputusan untuk memecahkan masalah dalam sebuah sitasi yang tidak terstruktur menjadi bagian yang terstruktur untuk menampilkan permasalahan yang dihadapi, kemudian mengurutkan prioritas melalui perbandingan matriks berpasangan (Fatmawati et al., 2017).

Metode ini sering disebut Metode Saaty, diambil dari nama pengembangnya Thomas Lorie Saaty pada tahun 1980 (Masitha et al., 2018).

#### **2.3.4 Metode MOORA**

Metode *Multi-Objective Optimization on the basis of Ratio Analysis* (MOORA) merupakan metode sistem pendukung keputusan yang menggunakan perhitungan rumit untuk memberikan sebuah keputusan. Metode yang dikembangkan oleh Brauers dan Zavadskas ini memiliki beberapa langkah penyelesaian, yaitu (Fadlan et al., 2019):

- a. Input nilai kriteria
- b. Membuat matriks keputusan
- c. Normalisasi metode MOORA
- d. Pengoptimalan Atribut
- e. Mengurangi nilai max dan min
- f. Perankingan

#### **2.3.5 Metode WP**

Metode *Weighted Product* (WP) adalah sebuah metode sistem pendukung keputusan menggunakan perkalian untuk menghubungkan rating atribut, dengan memangkatkan atribut dengan bobotnya (Jakaria, 2018). Penyelesaian menggunakan metode WP yaitu (Amalia et al., 2019):

- a. Penentuan kriteria
- b. Konversi data menjadi rating kecocokan
- c. Perbaikan nilai bobot setiap kriteria
- d. Menentukan nilai preferensi
- e. Menghitung nilai preferensi

#### **2.3.6 Metode SMART**

Metode *Simple Multi Attribute Rating Technique* (SMART) merupakan salah satu metode sistem pendukung keputusan yang berdasarkan pada teori bahwa setiap alternatif terdiri dari sejumlah kriteria yang memiliki nilai dan bobot yang menggambarkan pentingnya bobot tersebut dari kriteria lain. Metode SMART dikembangkan tahun 1997 oleh Edward (Magrisa et al., 2018).

### 2.3.7 Perbandingan Metode Sistem Pendukung Keputusan

Dalam membuat sebuah sistem atau perancangan sistem pendukung keputusan, terdapat beragam metode yang dapat digunakan seperti yang telah dijelaskan. Setiap metode memiliki kelebihan dan kekurangan masing-masing. Perbandingan metode-metode sistem pendukung keputusan dapat dilihat pada Tabel 2.2.

Tabel 2.2 Perbandingan Metode Sistem Pendukung Keputusan

| Metode                          | Kelebihan  | Kekurangan   |
|---------------------------------|--|--|
| TOPSIS                          | <ul style="list-style-type: none"> <li>Menggunakan indikator kriteria dan variable alternatif sebagai pembantu pengambilan keputusan</li> <li>Komputasi yang efisien</li> <li>Mampu dijadikan pengukur kinerja alternatif</li> </ul>   | <ul style="list-style-type: none"> <li>Belum ada penentuan bobot prioritas yang menjadi prioritas hutungan</li> <li>Perankingan kurang tepat apabila ada atribut bernilai nol (0)</li> <li>Tidak mempertimbangkan kepentingan relatif dari masing-masing jarak solusi</li> </ul> |

| WP<br>(Amalia et al., 2019)     | <ul style="list-style-type: none"> <li>Mempercepat proses perhitungan nilai kriteria dan peringkat alternatif</li> <li>Dapat digunakan untuk pengambilan keputusan <i>single</i> dimensi</li> </ul>  | <ul style="list-style-type: none"> <li>Kurang populer dibanding metode sistem pendukung keputusan lain</li> <li>Hanya merupakan metode matematis tanpa pengujian</li> </ul>  |
| SMART<br>(Magrisa et al., 2018) | <ul style="list-style-type: none"> <li>Mudah dimodifikasi ketika jumlah data berubah</li> <li>Analisis menggabungkan berbagai macam kriteria kuantitatif dan kualitatif</li> <li>Tidak bergantung pada alternatif</li> </ul>   | <ul style="list-style-type: none"> <li>Peringkat alternatif tidak relatif</li> <li>Terlalu banyak atribut yang dibutuhkan</li> <li>Mengabaikan hubungan timbal-balik antar parameter</li> </ul>  |

Berdasarkan penjelasan pada Tabel 2.2, diketahui kelebihan dan kekurangan masing-masing metode sistem pendukung keputusan. Pada penelitian ini akan dibuat sebuah sistem untuk mengetahui siapa saja pemain yang layak dijadikan rekomendasi untuk membentuk sebuah tim dalam *game* Fantasy Premier League. Dalam prosesnya, perancangan sistem ini akan diberikan data berupa empat kategori posisi dengan masing-masing kategori memiliki atribut yang berbeda. Nilai atribut dari setiap pemain pada masing-masing kategori diambil dari situs resmi *game* Fantasy Premier League. Oleh karena itu ditetapkan metode yang digunakan pada penelitian ini yaitu metode SAW. Metode SAW digunakan dalam pemilihan pemain dalam posisi sepakbola karena memiliki komputasi yang efektif dan efisien, penilaian kinerja setiap alternatif kompleks, serta akurasi metode yang tinggi (Prasetyo et al., 2016).

## 2.4 Penelitian Terkait

Penelitian sebelumnya pernah dilakukan oleh Sigit Prasetyo (2016) mengenai pemilihan pemain pada posisi tertentu dalam sepakbola menggunakan Metode SAW. Langkah-langkah dalam penelitian ini adalah (a) menentukan posisi pemain, (b) menentukan kriteria-kriteria dalam permainan sepakbola yang mempengaruhi data, (c) menentukan kriteria pada posisi yang diinginkan, (d) mengelola musim permainan, (e) mengelola data pemain yang mengikuti seleksi posisi, (f) mengolah data statistik kriteria pemain pada musim tersebut, (g) melakukan proses SAW. Hasil penelitian ini adalah *prototype* aplikasi SPK penentuan pemain dalam posisi tertentu dengan menggunakan Metode SAW.

Penelitian lainnya pernah dilakukan oleh Aldi Nurzahputra (2017) mengenai pemilihan *line-up* pemain sepakbola menggunakan metode FMADM SAW dan *K-Means Clustering*. Dalam penelitian tersebut, peneliti memilih pemain dari hasil pembobotan beberapa kriteria, yaitu *goals*, *assists*, *saves*, *cleansheets*, *yellow cards*, *red cards*, *played*, dan *own goals*. Penilaian performa pemain menggunakan metode *K-Means Clustering* dengan dua *cluster*, yaitu *cluster\_baik* dan *cluster\_cukup*. Data yang digunakan adalah data pemain dari klub Manchester City.

Penelitian lainnya dilakukan oleh Oki Iskandar (2020) tentang pemilihan pemain sepakbola menggunakan metode TOPSIS. Hasil dari penelitian ini adalah sebuah sistem pendukung keputusan rekomendasi pemain sepakbola terbaik pada Liga X berdasarkan kriteria *minutes played*, *appearances*, *goals*, *assists*, *yellow cards*, *red cards*, *shots on target*, *touches*, *passes*, *blocks*, *fouls*, *interceptions*, *tackles*, *saves*, dan *goals conceded*. Hasil penelitian ini dapat dimanfaatkan penyelenggara dalam pemilihan pemain terbaik, dan

manajemen tim dalam melakukan pemilihan pemain. Hasil pengujian dari penelitian ini adalah sebesar 57.14% dari hasil sebenarnya.

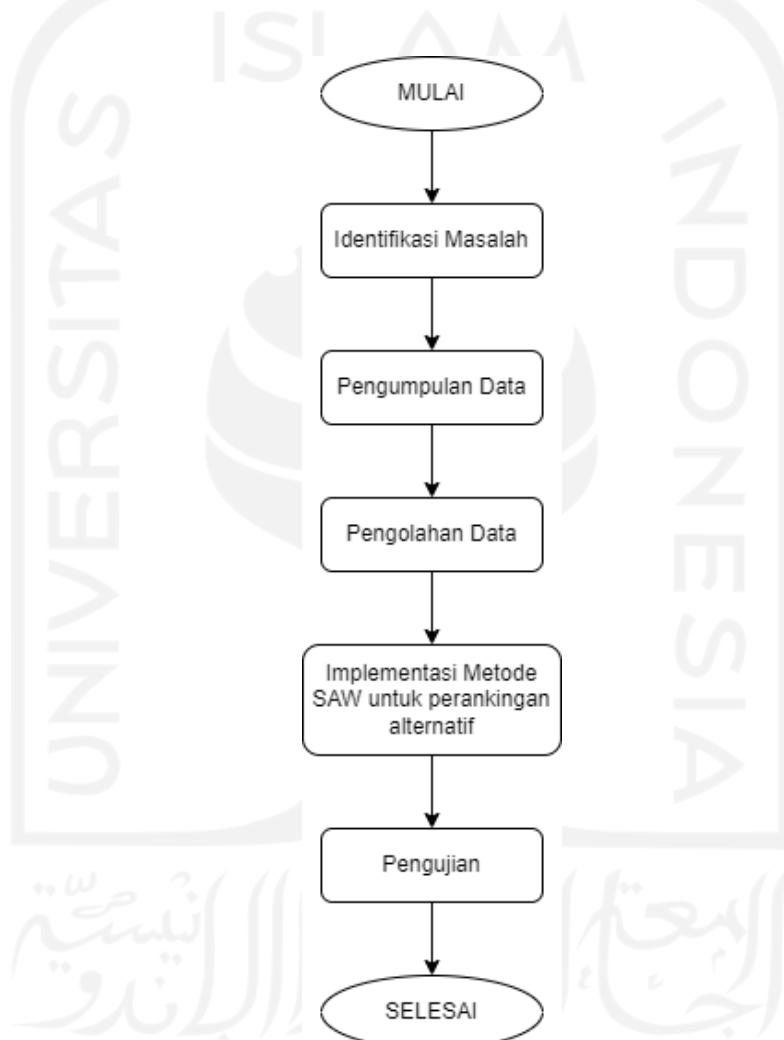

Kemudian penelitian lainnya juga pernah dilakukan oleh Gupta dan Akhil (2017) tentang membentuk tim impian pada game Fantasy Premier League. Penelitian ini menggunakan metode ARIMA dan RNN untuk memprediksi poin pemain dan memaksimalkan total poin menggunakan *Linear Programming* (LPP). Penelitian ini mengambil data dari tiga musim terakhir kemudian membuat prediksi untuk poin pada musim ini menggunakan ARIMA dan RNN. Tipe pemain yang digunakan adalah *goalkeeper*, *defender*, *midfielder*, dan *forward*.

### BAB III

### METODOLOGI PENELITIAN

#### **3.1 Metode Penelitian**

Metode yang digunakan pada penelitian ini adalah *waterfall method* (metode air terjun). Tahapan dan langkah-langkah penelitian dapat dilihat pada Gambar 3.1.

Gambar 3.1 Alur Penelitian

#### **3.2 Identifikasi Masalah**

Fantasy Premier League telah dimainkan oleh lebih dari 9 juta orang di seluruh dunia, hampir 50% berasal dari Inggris dan Irlandia (Bhatt et al., 2019). Orang yang memainkan *game* ini, oleh *game master* Fantasy Premier League disebut sebagai manajer. Setiap manajer memiliki taktik dan strategi tersendiri dalam membangun tim impian mereka. Sebagian besar

manajer hanya mengandalkan *feeling* dan *sentiment* mereka dalam pemilihan pemain (Bhatt et al., 2019). Hanya beberapa persen yang menggunakan data dan statistik untuk membantu mereka dalam pemilihan pemain.

### 3.3 Pengambilan Data

Sumber utama data yang akan digunakan pada penelitian ini berasal dari situs <https://fantasy.premierleague.com/>. Situs ini merupakan situs resmi game Fantasy Premier League yang telah diakui oleh FA (*Football Association*) atau Federasi Sepakbola Inggris (Bonello et al., 2019). Data yang diperlukan dalam penelitian ini adalah data nama pemain, kategori posisi pemain, serta atribut-atribut dari setiap kategori posisi. Atribut yang digunakan adalah statistik keseluruhan dalam satu musim terakhir.

Alternatif diambil dari 20 klub yang berlaga di Liga Primer Inggris. Jumlah alternatif yang diambil dari setiap kategori posisi adalah 50% (pembulatan ke atas) dari aturan jumlah pemain untuk masing-masing posisi pada *game* Fantasy Premier League, hal ini berdasarkan kemungkinan terpilihnya >50% (pembulatan ke atas) alternatif sangat jarang terjadi. Jika dan hanya jika hal tersebut terjadi, manajer dipastikan melanggar aturan dari *game* Fantasy Premier League ini, yaitu pemilihan pemain dari satu klub maksimal adalah tiga pemain. Jumlah alternatif yang diambil dari setiap kategori posisi yaitu: penjaga gawang (1 alternatif), pemain bertahan (3 alternatif), pemain tengah (3 alternatif), dan pemain depan (2 alternatif). Alternatif terpilih adalah alternatif yang memiliki total poin tertinggi dari setiap kategori posisi dalam satu klub. Alternatif yang akan digunakan pada penelitian ini dapat dilihat pada Tabel 3.1.

### 3.4 Prosedur Metode SAW

Konsep dari metode SAW terbagi menjadi beberapa langkah yang akan dijelaskan sebagai berikut (Nurlela et al., 2019):

- A. Menentukan kriteria ( $C$ ) yang akan dijadikan pilihan pengambilan keputusan
- B. Menentukan rating kecocokan tiap alternatif ( $A$ ) pada kriteria ( $C$ )
- C. Membuat matriks ternormalisasi ( $R$ ) berdasarkan kriteria ( $C$ ) menggunakan Persamaan (3.1).

$$r_{ij} = \begin{cases} \frac{x_{ij}}{\max x_{ij}}, & j = \text{benefit} \\ \frac{\min x_{ij}}{x_{ij}}, & j = \text{cost} \end{cases} \quad (3.1)$$

- D. Pemeringkatan setiap alternatif menggunakan Persamaan (3.2).

$$V_i = \sum_{j=1}^n w_j r_{ij} \quad (3.2)$$

### 3.5 Pengolahan Data

Pengolahan data terbagi menjadi beberapa langkah yaitu penentuan kategori posisi pemain, penentuan atribut dari masing-masing kategori posisi pemain, penentuan bobot setiap atribut dari masing-masing kategori posisi pemain, dan penentuan jenis atribut.

#### 3.5.1 Penentuan Kategori Posisi

Data yang digunakan dalam penelitian ini dibagi menjadi empat kategori, sesuai dengan posisi dalam formasi tim sepakbola (Kristiansen et al., 2018), yaitu penjaga gawang (*goalkeeper*), pemain bertahan (*defender*), pemain tengah (*midfielder*), dan pemain depan (*striker*).

#### 3.5.2 Penentuan Atribut Kategori Posisi

Setiap kategori posisi akan diberikan masing-masing tiga atribut unik sesuai dengan peran dan tugasnya dalam sebuah tim dan dua atribut tetap untuk semua kategori posisi. Sistem yang akan dibuat adalah sistem fleksibel yang dapat mencakup setiap atribut pada *game Fantasy Premier League*. Pada penelitian ini akan diberikan dua contoh skenario atribut tetap. Contoh atribut skenario diambil berdasarkan tipe manajer dalam pemilihan pemain.

Skenario 1 adalah skenario berdasarkan tipe manajer yang akan menerima secara langsung hasil yang diberikan oleh sistem dengan atribut tetap jumlah transfer keluar (*transfers out*) dan harga (*price*). Hal ini dikarenakan atribut *transfers out* (TO) adalah konklusi jumlah berapa kali seorang pemain dikeluarkan dari tim oleh seluruh manajer yang memainkan *game Fantasy Premier League* (Palsam, n.d.).

Skenario 2 adalah skenario berdasarkan tipe user yang masih mempertimbangkan poin tambahan dalam memilih pemain yang akan dimasukkan ke dalam timnya dengan atribut tetap sistem poin bonus (*bonus point system / BPS*) dan harga (*price*). Hal ini karena BPS adalah salah satu cara untuk mendapatkan poin pada *game Fantasy Premier League* (Bhatt et al., 2019). BPS adalah sebuah fitur pada *game FPL* yang memungkinkan pemain mendapatkan poin tambahan dalam satu pertandingan. Poin yang didapatkan pada BPS dihitung melalui statistik pemain oleh OPTA (Kristiansen et al., 2018). Namun demikian, pemain yang mendapatkan poin tambahan dari BPS hanya pemain dengan poin BPS tiga teratas dengan rincian 3 poin untuk peringkat 1, 2 poin untuk peringkat 2, dan 1 poin untuk

peringkat 3 (Gibbons, 2014). Atribut BPS tidak dimasukkan ke dalam atribut unik dikarenakan hanya tiga pemain yang akan mendapatkan poin dari BPS dalam satu pertandingan. Cara mencetak poin pada BPS dapat dilihat pada Tabel 3.2.

Tabel 3.2 Nilai Poin BPS

| Aksi  | BPS |

| Bermain sampai 60 menit   | 3   |
| Bermain lebih dari 60 menit   | 6   |

| Terkena <i>tackle</i>   | -1  |
| Melakukan pelanggaran   | -1  |
| Terperangkap <i>offside</i>   | -1  |
| Tendangan keluar  | -1  |

Posisi penjaga gawang merupakan pertahanan terakhir dari sebuah tim yang dapat menyelamatkan gawangnya dari kebobolan, karena itu akan diberikan atribut jumlah penyelamatan (*saves*). Penjaga gawang juga satu-satunya pemain yang dapat menggagalkan tendangan penalti lawan, karena itu diberikan atribut penyelamatan penalti (*penalties saved*). Kemudian penjaga gawang adalah salah satu kategori posisi yang tugas utamanya adalah menjaga gawang agar tidak kebobolan oleh lawan, karena itu diberikan atribut tanpa kebobolan (*clean sheets*) untuk kategori posisi penjaga gawang.

Posisi pemain bertahan merupakan posisi dengan tugas utama mempertahankan area belakang tim agar pemain lawan tidak dapat mencapai atau berhadapan langsung dengan penjaga gawang. Pemain bertahan juga secara tidak langsung bertugas menjaga gawang tim agar tidak kebobolan oleh lawan, karena itu diberikan atribut tanpa kebobolan (*clean sheets*). Selain itu, pemain bertahan juga tidak jarang harus bertugas membantu tim dalam mencetak angka, karena itu diberikan atribut jumlah gol (*goals scored*) dan jumlah umpan (*assists*).

Posisi pemain tengah adalah posisi dengan tugas utama mengatur cara bermain sebuah tim dan merupakan otak dari permainan tim tersebut, oleh karena itu diberikan atribut kreativitas (*creativity*). Pemain bertahan juga bertugas untuk mencetak angka ke gawang lawan, karena itu diberikan atribut jumlah gol (*goals scored*) dan jumlah umpan (*assists*).

Tugas prioritas pemain dengan posisi pemain depan adalah mengancam gawang lawan melalui peluang-peluang yang didapatkan, karena itu diberikan atribut nilai ancaman (*threats*) untuk posisi ini. Selanjutnya tugas dari pemain depan adalah mencetak angka sebanyak mungkin ke gawang lawan, karena itu diberikan atribut jumlah gol (*goals scored*) dan jumlah umpan (*assists*).

Pemetaan atribut kategori posisi yang diperlukan pada penelitian ini dapat dilihat pada Tabel 3.3 Tabel 3.4.

### 3.5.3 Penentuan Jenis Atribut Kategori

Kemudian pada tahap ini akan menentukan jenis dari atribut kategori yang telah dijelaskan pada Tabel 3.3 dan Tabel 3.4. Jenis atribut kategori ini terbagi menjadi dua, yaitu *benefit* dan *cost*. *Benefit* adalah atribut yang semakin tinggi nilainya maka akan semakin bagus, sedangkan *cost* adalah atribut yang semakin rendah nilainya semakin bagus (Nurlela et al., 2019). Setiap kategori akan diberikan tiga atribut *benefit* dan dua atribut *cost*. Pembagian jenis atribut kategori posisi dapat dilihat pada Tabel 3.5 Tabel 3.6.

### 3.5.4 Penentuan Bobot Atribut Kategori

Setiap skenario atribut kategori akan dibagi lagi menjadi dua sub-skenario, yaitu skenario 1A, skenario 1B, skenario 2A dan skenario 2B. Setiap atribut kategori akan diberikan bobot yang berbeda-beda. Pemberian bobot atribut kategori ditentukan dengan menilai seberapa besar pengaruh yang diberikan atribut tersebut dalam sepakbola dan/atau seberapa besar frekuensi terjadinya hal tersebut (Palsam, n.d.). Nilai bobot atribut masing-masing kategori posisi dapat dilihat pada Tabel 3.7 Tabel 3.8 Tabel 3.9 dan Tabel 3.10.

Pada sistem ini sebenarnya semua kategori posisi memiliki atribut yang sama. Tapi pada perhitungannya, selain atribut yang dijelaskan pada Tabel 3.7 Tabel 3.8 Tabel 3.9 dan Tabel 3.10, atribut kategori tersebut akan diberikan bobot 0%, yang pada hasil akhirnya tidak akan mempengaruhi nilai preferensi alternatif.

### 3.5.5 Data Alternatif

Kemudian akan dilakukan pengumpulan alternatif dari setiap kategori posisi dengan atribut, bobot atribut dan jenis atributnya. Untuk memudahkan input data pada atribut *transfers out*, BPS, *creativity*, dan *threats* akan dilakukan konversi nilai ke bilangan *crisp* karena nilai dari atribut-atribut tersebut terlalu besar. Konversi nilai dari atribut tersebut dapat dilihat pada Tabel 3.11 Tabel 3.12 dan Tabel 3.13

Keterangan:

A : *assists* (jumlah umpan)

GS : *goals scored* (jumlah gol)

T : *threats* (ancaman)

TOC : *transfers out conversion* (jumlah transfer keluar)

BPS : *bonus point system*

P : *price* (harga)

Pada sistem ini akan diberikan satu alternatif *dummy* untuk mengatasi atribut kosong dengan bobot 0% agar tidak terjadi *error* saat perhitungan. Karena jika salah satu atribut dari setiap kategori posisi bernilai 0 untuk semua alternatif, maka akan terjadi pembagian dengan 0 yang menyebabkan hasil *infinity* / tak hingga ( $\infty$ ).

#### c. Menghitung Nilai Preferensi Alternatif

Setelah mendapatkan nilai dari elemen matriks ternormalisasi (*R*), maka akan dilakukan perhitungan untuk mencari nilai preferensi (*V*) dari setiap alternatif pada semua kategori posisi. Nilai preferensi didapatkan dengan menjumlahkan hasil perkalian elemen matriks ternormalisasi (*R*) dengan bobot yang telah ditentukan pada Tabel 3.7.

Gambar 4.14 Matriks Keputusan Ternormalisasi Penjaga Gawang

#### c. Menghitung Nilai Preferensi Alternatif

Setelah mendapatkan nilai dari elemen matriks ternormalisasi ( $R$ ), maka akan dilakukan perhitungan untuk mencari nilai preferensi ( $V$ ) dari setiap alternatif pada semua kategori posisi. Nilai preferensi didapatkan dengan menjumlahkan hasil perkalian elemen matriks ternormalisasi ( $R$ ) dengan bobot yang telah ditentukan pada Tabel 3.7.

#### c. Menghitung Nilai Preferensi Alternatif

Setelah mendapatkan nilai dari elemen matriks ternormalisasi ( $R$ ), maka akan dilakukan perhitungan untuk mencari nilai preferensi ( $V$ ) dari setiap alternatif pada semua kategori posisi. Nilai preferensi didapatkan dengan menjumlahkan hasil perkalian elemen matriks ternormalisasi ( $R$ ) dengan bobot yang telah ditentukan pada Tabel 3.7.

Gambar 4.20 Matriks Keputusan Ternormalisasi Penjaga Gawang

#### b. Menghitung Nilai Preferensi Alternatif

Setelah mendapatkan nilai dari elemen matriks ternormalisasi ( $R$ ), maka akan dilakukan perhitungan untuk mencari nilai preferensi ( $V$ ) dari setiap alternatif pada semua kategori posisi. Nilai preferensi didapatkan dengan menjumlahkan hasil perkalian elemen matriks ternormalisasi ( $R$ ) dengan bobot yang telah ditentukan pada Tabel 3.7.

### **KESIMPULAN DAN SARAN**

#### **5.1 Kesimpulan**

Setelah melakukan perbandingan antara output dari sistem yang dibuat dan hasil akhir perhitungan secara manual menggunakan Microsoft Excel, diketahui keduanya memiliki tingkat similaritas yang sempurna sebesar 100%. Oleh karena itu dapat diambil kesimpulan bahwa pada penelitian ini telah berhasil dibuat sebuah sistem untuk membantu pemilihan pemain pada *game* Fantasy Premier League.

Hasil output dari sistem ini berfungsi hanya sebagai alat untuk membantu merekomendasikan alternatif-alternatif terbaik berdasarkan perhitungan menggunakan metode SAW. Keputusan akhir dalam pemilihan pemain tetap akan dikembalikan kepada manajer.

#### **5.2 Saran**

Dari penelitian yang telah dilakukan, diketahui bahwa pada penelitian ini masih terdapat banyak kekurangan, oleh karena itu untuk penelitian selanjutnya jika penelitian ini ingin dikembangkan, berikut beberapa saran dari penulis, yaitu:

- a. Penelitian ini belum mendukung aturan dari *game* Fantasy Premier League yaitu pemilihan pemain dari satu klub maksimal tiga pemain, oleh karena itu untuk penelitian selanjutnya diharapkan dapat menerapkan batasan implementasi tersebut.
- b. Penelitian ini belum mendukung aturan dari *game* Fantasy Premier League yaitu maksimal *total price* (harga) dari sebuah tim adalah 100, oleh karena itu untuk penelitian selanjutnya diharapkan dapat menerapkan batasan implementasi tersebut.
- c. Menambahkan metode SPK lain sebagai perbandingan agar lebih banyak opsi yang ditawarkan kepada pengguna.
