FOREWORD

Assalamualaikum Wr. Wb.

Alhamdulillahirabbil'alamin, the researcher would like to express her gratitude to the presence Allah SWT for all His Grace and Gifts to that researcher could complete a thesis entitled **“THE INFLUENCE OF MARKET VOLATILITY OF CRYPTOCURRENCY, FOREIGN EXCHANGE, AND GOLD TOWARD RETURN ON INVESTMENT”**. This thesis was written to fulfil requirements for obtaining a Bachelor of Accounting (S.Ak) degree at the Universitas Islam Indonesia, Yogyakarta. On this occasion the researcher would like to thank to all who have helped in this research process and during the thesis writing. I would like to extend my thanks and gratitude to:

1. Prof. Fathul Wahid, S.T., M.Sc., Ph.D, as the Rector of the Universitas Islam Indonesia.
2. Prof. Johan Arifin, S.E., M.Si., Ph.D, as Dean of the Faculty of Business and Economics at Universitas Islam Indonesia.
3. Drs. Dekar Urumsah, S.Si., M.Com. (IS), Ph.D., C.Fr.A. as Head of Department Accounting, Faculty of Business and Economics, Universitas Islam Indonesia.
4. Prof. Rifqi Muhammad, S.E., S.H., M.Sc., Ph.D., SAS, ASPM as Head of the Accounting Study Program, Faculty of Business and Economics, Universitas Islam Indonesia.

5. Mrs. Ayu Chairina laksmi, S.E., M.App.Com., M.Res., Ph.D., Ak., CA as the supervisor who has directed and guided me during the completion of this thesis.
6. Mrs. Ata Muftihah, S.S., S.Pd. as the language advisor who has directed and guided me during the completion of this thesis.
7. All lecture and staff within the Faculty of Business and Economics, Universitas Islam Indonesia
8. The late Ahmad Jamal and Nursalfiyetti Z as the researcher's parents who always pray and motivate me to complete this research.
9. All parties involved who cannot be named, thank you for your contribution during the process of preparing this thesis.

The researcher realizes that there is still a lot of lack in writing this thesis. For this reason, input in the form of constructive criticism and suggestion is very welcome. The author hopes that this thesis can provide good benefits for those in need.

Wassalamualaikum Wr. Wb.

Gina Mufidah Jamal

ABSTRACT

Investing in Indonesia has undergone significant changes in recent years with growing interest in cryptocurrencies, foreign exchange and gold. While these instruments offer attractive potential returns, the high level of volatility poses a challenge for investors. Lack of understanding about risk management and the different characteristics of each instrument can lead to suboptimal investment decisions. This study aims to analyze the effect of cryptocurrency, foreign exchange, and gold market volatility on return on investment (ROI). This research uses a quantitative approach with secondary data in the form of historical Bitcoin prices, US Dollar exchange rates, and gold prices during the period 2019 to 2023. The analysis used in this research is statistical testing in the form of multiple linear regression methods using SPSS software version 30. The results show that cryptocurrency market volatility has a negative and significant effect on ROI. Foreign exchange market volatility has a negative and insignificant effect on ROI. Gold market volatility has a negative and insignificant effect on ROI.

Keywords: market volatility, cryptocurrency, foreign exchange, gold, and return on investment (ROI)

ABSTRAK

Investasi di Indonesia telah mengalami perubahan signifikan dalam beberapa tahun terakhir dengan meningkatnya minat terhadap mata uang kripto, valuta asing, dan emas. Meskipun instrumen ini menawarkan potensi pengembalian yang menarik, tingkat volatilitas yang tinggi menimbulkan tantangan bagi investor. Kurangnya pemahaman tentang manajemen risiko dan perbedaan karakteristik setiap instrumen dapat menyebabkan keputusan investasi yang kurang optimal. Penelitian ini bertujuan untuk menganalisis pengaruh volatilitas pasar mata uang kripto, valuta asing, dan emas terhadap pengembalian investasi (ROI). Penelitian ini menggunakan pendekatan kuantitatif dengan data sekunder berupa harga Bitcoin historis, nilai tukar Dolar AS, dan harga emas selama periode 2019 hingga 2023. Analisis yang digunakan dalam penelitian ini adalah pengujian statistik berupa metode regresi linier berganda dengan menggunakan perangkat lunak SPSS versi 30. Hasil penelitian menunjukkan bahwa volatilitas pasar mata uang kripto berpengaruh negatif dan signifikan terhadap ROI. Volatilitas pasar valuta asing berpengaruh negatif dan tidak signifikan terhadap ROI. Volatilitas pasar emas berpengaruh negatif dan tidak signifikan terhadap ROI.

Kata kunci: volatilitas pasar, cryptocurrency, valuta asing, emas, return on investment (ROI)

CHAPTER I

INTRODUCTION

1.1 Background

Money is one medium of exchange that has endured for centuries. Each country has its own currency that can be used for transactions in its own country, although it may not be valid in other countries. For example, in the United States where the dollar is used, the rupiah would not be applicable. Currency has become an important part of the world economy, including in Indonesia, as it plays a significant role in investment decisions and financial reporting. Investment trends in Indonesia have undergone major changes in recent years, with growing interest in cryptocurrencies, foreign exchange, and gold. While each of these instruments offers the potential for attractive returns, they also carry significant risks. Factors such as the high volatility of cryptocurrencies, changes in the value of foreign currencies, and changes in the price of gold pose challenges for investors and market participants.

One important issue in Indonesia today is the lack of in-depth understanding of managing and comparing the returns and risks of these three investment instruments. Many investors, especially retail and beginner investors, do not fully understand how the volatility and characteristics of each instrument affect the potential returns and risks. This ignorance can result in sub-optimal investment decisions, potentially resulting in a large cut in profits. Comparing the returns and risks of gold,

cryptocurrencies, and foreign exchange is not just for academic purposes, but also has significant practical consequences. For example, investors who do not understand the risks of cryptocurrencies may incur huge losses due to the tremendous price fluctuations. Conversely, a better understanding of risks and returns can help them make more accurate decisions and better manage their risks.

According to Hanif (2024), money was first initiated by the Lydians in the 6th century BC. The money was made of gold and silver and had a shape like a pea. In 546-560 BC, Croesus created metal money which was then used by the Greeks. In history, the Greeks were the first nation to invent metal money. The Greeks designed metal money with a variety of interesting images where the exchange rate of the money was determined by the material it was made of. After metal money was discovered, the next was the discovery of paper money created by the Chinese in the first century AD more precisely during the Tang Dynasty kingdom. Paper money was created because of the difficulties faced. The difficulty is the limited supply of precious metals (gold and silver) for large transactions, so it is very difficult to use metal money in transactions. Over time in 1946 credit and debit cards as a non-cash transaction tool that we still use today.

Currency is defined as the unit of money value of a country. Meanwhile, if you want to conduct international economic transactions, you can use foreign exchange. According to Hull (2018), foreign exchange

is a global market where currencies of different countries are traded against each other, and exchange rates are affected by various factors including interest rates, inflation, and the political situation. Based on data from CNBCIndonesia.com (2021) the 5 most traded currencies in the international market and on foreign exchange are United States Dollar (USD), Singapore Dollar (SGD), Japanese Yen (JPY), Euro (EUR), British Pound Sterling (GBP). Many investors invest their wealth through foreign currencies where they will benefit from the difference between the selling price and the buying price (exchange rate difference). The basic principle is to buy a certain amount of foreign currency when the price goes down and then sell it when the price goes up. The exchange rate is highly dependent on a country's macroeconomic conditions such as inflation rate, interest rate, trade balance, public debt, and economic stability of a country.

At a time when money or legal tender had not yet been created in every country, economic societies or trading processes carried out transactions by exchanging goods or services, known as bartering. Bartering is usually done by exchanging goods or services that are close in value. One of the earliest forms of trade was commerce. The Mesopotamians first used Barter, which was later adopted by the Phoenicians and then spread throughout the world. The essence of symbiotic mutualism is the direct exchange of goods and services for mutual benefit. One example of how bartering is still used today is

Venezuelan fishermen who exchange the fish they catch for food and medicine due to the hyperinflation in the country for several years which made their currency worthless.

Forex trading is a way of investing or business that can make money without having complicated rules and regulations and does not require a lot of capital. Warren Buffett, one of the world's famous forex traders, argues that forex is the best money-making machine in the world that has never been matched by anyone else. The forex market is unlike the stock market or stock exchange, where prices change frequently.

Digital currencies that are exchanged between people through certain cryptographic principles are called cryptocurrencies. Bitcoin is the most famous cryptocurrency. Bitcoin, created by Satoshi Nakamoto, an unknown person in 2009, is a new cryptocurrency that is a phenomenon in today's digital world. It was the first known type of digital currency and remains the market leader today. Bitcoin was the world's first digital currency and it was officially released in 2010. The digital currency is growing due to its popularity as an alternative payment method around the world. According to Big More (2018), bitcoins that could initially be purchased for \$100 per coin now cost more than \$30,000, or around Rp. 400 million, to obtain one coin.

Shares indicate that a person has ownership in a company. Shares listed in the capital market are referred to as tradable shares. The Indonesia Stock Exchange (IDX) is the capital market in Indonesia. The IDX has a

Composite Stock Price Index (CSPI) and has various types of stocks based on the type of company.

Investors can now invest their assets not only in property due to the development of the digital era, but also in Foreign Exchange (forex), stocks, and the latest instrument Crypto. Forex trading is a way of investment or business that can make money without requiring a lot of rules and procedures. This is in line with the way people see results in clearly visible fields such as real goods and services. As a result, they tend to invest their money in property and the purchase of other goods and services if they have a lot of money. Many people will choose to invest in stocks and mutual funds if they want to invest in a non-real sector. However, as people's knowledge and understanding of investing in Indonesia in particular increases, many people are starting to become interested in investing in cryptocurrencies and forex rather than just investing in real fields or instruments.

Research related to the comparison of return and risk of investment instruments has been carried out by several previous studies such as research conducted by Meiyura and Azib (2020) which conducted research related to the comparison of return and risk values between gold and bitcoin. Lumbantobing and Sadalia (2021) conducted research related to the comparison of the return value, and risk of bitcoin cryptocurrency, stocks, and gold. Ichsani and Pamungkas (2022) stated that study examine the return and risk values of three types of cryptocurrencies, stocks, and

gold from 2017 to 2021. Previous research shows that the risk value has a significant difference, while the return value does not.

Research related to the comparison of the coefficient of variation has been conducted by previous researchers conducted by Haanurat et al., (2021) this study discusses the comparison of the return value, risk, and coefficient of variation of conventional and Sharia stocks on the LQ45 index. The results show that there is no significant difference in value between the return, risk, and coefficient of variation of each stock in LQ45.

Based on the phenomenon and some previous research results that have been described, the researcher wants this study to not only compare the returns and risks of the three investment instruments but also to explore the practical implications of these differences. Using quantitative methods, this research seeks to provide clear and measurable data on the performance of each instrument, as well as the risk management challenges faced by investors. The results of this study are expected to help investors in choosing better investment strategies, as well as provide insights for policymakers in developing more effective regulations.

This research was carried out by looking at some previous research and using data sources from the online trading platform investing.com and the Pegadaian website to find out the history of market value movements. These two platforms were chosen because they offer several advantages, including completeness of historical data, ease of use, credibility, and flexibility in accessing and exporting data for analysis. This research cited

the research of Aryadwithya (2022) in which there are differences between the range of years and the author uses gold as a differentiating instrument. Based on this background, the authors are interested in taking the title “The Influence of Market Volatility of Cryptocurrency, Foreign Exchange, and Gold Toward Return On Investment 2019-2023”.

1.2 Problem Formulation

Based on the background described above, the problem formulations in this study are:

- 1 How does the market volatility of cryptocurrency affect the return on investment?
- 2 How does the market volatility of foreign exchange affect return on investment?
- 3 How does the market volatility of gold affect the return on investment?

1.3 Research Objective

Based on the problem formulation above, the objectives of this study are as follows:

1. To analyze the effect of return on investment on market volatility of cryptocurrency.
2. To analyze the effect of return on investment on market volatility of foreign exchange.
3. To analyze the effect of return on investment on market volatility of gold.

1.4 Research Benefit

The results of the research conducted are expected to provide the following benefits:

1. For Individual and Institutional Investor:

This research is expected to provide greater insight into the risks and returns associated with cryptocurrencies, foreign exchange, and gold, helping investors make smarter investment decisions. The information provided is based on the return and risk profile of each instrument, which can be used to develop better investment strategies.

2. For Academics and Researchers:

By providing a comparative analysis of the impact of inflation on various financial instruments, this research will be add to the existing body of knowledge. It can also serve as a basis for future research on related topics, such as the role of technological progress in financial stability or the long-term impact of inflation on financial markets.

1.5 Systematization of Writing

The systematic writing that will be used in this research is as follows:

CHAPTER I: BACKGROUND

This chapter contains the background of the problem, problem formulation, research objective, research benefit, and writing systematic.

This chapter will provide an overview of the research and guide the reader in understanding the issues discussed in the research.

CHAPTER II: LITERATURE REVIEW

This chapter will discuss various theories and several previous studies used as references in this study as well as the hypotheses to be tested.

CHAPTER III: RESEARCH METHOD

This chapter contains the sample population, data collection methods, research methods, research variables, and data analysis methods.

CHAPTER IV: ANALYSIS AND DISCUSSION

This chapter will present the result and analysis containing a description of the object of research, analysis of related data, and interpretation of the result in accordance with the technique used.

CHAPTER V: CLOSING

This chapter contains conclusions, research limitations, and suggestions for further research. The conclusion is the answer to the formulation of the problem that has been stated and the achievement of research objectives.

CHAPTER II

LITERATURE REVIEW

2.1 Theoretical Base

2.1.1 Efficient Market Hypothesis Theory

Fama (1970) stated that an efficient market is one in which asset prices consistently take into account all relevant information, both public and private. Over time, most active investments that attempt to outperform the market ultimately fall short of passive investments like market indices.

Smithers (2022) contended that different sectors have different applications. Based to some research, the infrastructure sector, for instance, tends to display a semi-strong form of market efficiency, meaning that stock prices react quickly to public information. In contrast, the commodity sector continues to display abnormal return opportunities, suggesting that the market is not completely efficient. According to Smithers (2022), a number of factors including investor behavior, poor information, and external policy effects, contribute to the frequent inefficiency of the market. Therefore, he emphasized how crucial it is to take these factors into account when assessing financial markets and choosing investment.

2.1.2 Investment

The word investment comes from investing which means investing or it can also mean planting money. Based on the Big Indonesian Dictionary, the word investment means investing money or capital in a company or project with the aim of making a profit. According to Suyanti and Hadi (2019), investment is a desire for how to use some of the existing funds to get big profits in the future.

2.1.3 Return and Risk

In choosing an investment, an investor must understand the relationship between risk and return. Ideally, the higher the level of risk of an investment, the higher the level of return that will be obtained. Return is the return on a securities or investment that is usually expressed in the form of a percentage rate (%). Herlambang and Kurniawati (2022) explained that return is the return that investors get from an investment that has been undertaken in a certain period.

The investor's goal in investing is to gain profit (return). However, the actual level of profit obtained by investors is not always the same as the previously expected level of profit or expected profit. This is due to the risk that the actual rate of return may differ from the previously expected rate of return. As a result, the actual rate of return is not always equal to the previously expected rate of return.

According to the Big Indonesian Dictionary (KBBI), risk is defined as an unpleasant (harmful, dangerous) result of an action.

According to Kasanah (2018), risk is the amount of difference that occurs between the investor's expected rate of return and the actual rate of return obtained at the end of the stock period.

2.1.4 Definition of Cryptocurrency

Cryptocurrency is the name given to a digital currency that is protected by cryptography. The term is made up of two words: cryptography, meaning secret code, and currency, meaning currency.

Cryptocurrency is a digital currency system that has features like ordinary currencies but allows users to make online payments for business transactions that occur without service fees, but still has a centralized trust authority (Syamsiah, 2021).

Meanwhile Narayanan et al. (2016) explained that cryptocurrency is a digital or virtual currency that uses cryptography as a way to secure the digital currency system. Cryptography provides a code of rules for the cryptocurrency system itself.

2.1.5 Peer-to-Peer and Blockchain

Peer-to-peer lending consists of procedures carried out by lenders and borrowers, borrower analysis, and mitigation carried out by peer-to-peer lending platforms (Wahyuningsih, 2019). According to Yaga et al. (2019), Blockchain is a digital ledger that distributes transactions that are handled cryptographically and grouped into blocks. Each block is cryptographically linked to the results of the previous block after validation and claiming a consensus decision.

2.1.6 Foreign Exchange

Foreign exchange is a foreign currency or other means of payment used to conduct or finance international financial economic transactions and has an official exchange rate set by the central bank. According to Rianda (2019), forex is a type of trade or transaction that exchanges a country's currency for another country's currency, this transaction occurs every 24 hours in the global currency market.

According to Rianda (2019), forex trading is grouped forms into 3 forms, namely as follows:

1. Spot Transaction

Spot transactions are the buying and selling of currencies with interbank payments and deliveries made within two business days.

2. Forward Transaction

Forward transaction is also called futures transactions in principle are transactions of a certain amount of currency with several other currencies with delivery at a future time. At the time of the contract, the exchange rate is fixed, but payment and delivery will only be made when the contract matures. For hedging and speculation purposes, forward transactions are very common.

3. Swap Transaction

Swap transactions in the interbank market are the purchase and sale of a certain amount of currency on different dates known as “spot against forward”. Where a dealer buys a currency in a spot transaction and resells the same currency to another bank at the same time.

2.1.7 Definition of Gold

Gold is a metal that has the highest value worldwide even in its raw form. According to Dynand and Kartawinata (2018), unlike other metals, gold is called the “Barometer of Fear” because it does not rust, change color, or fade easily. These natural properties make gold very valuable. People usually set aside their money to buy gold to protect their wealth during recessions. Inflation and deflation are two economic conditions that worry people. Over the years, gold has proven useful in protecting your wealth from inflation and deflation.

The price of gold is not always influenced by supply and demand. It is also influenced by overall economic events, such as global financial panics, uncontrolled increases in inflation, and political events.

2.1.8 Return On Investment (ROI)

According to Brigham and Houston (2019), ROI is a ratio used to assess how well an investment produces profits. ROI is a measure used to compare investment costs and profit. Additionally, they stress

how ROI can assist businesses in evaluating their entire financial performance.

2.2 Previous Research

In this study, the author used previous research journals that discussed Cryptocurrency, Forex Exchange, and Gold as references. The research conducted by Aryadwithya (2022), aimed to compare the value of Return, Risk, and Relative Risk of three instruments namely, Cryptocurrency (Bitcoin), Stocks (JKSE), and Forex (Dollar). 48 monthly closing prices during 2018-2021 for each instrument are compared using the Kruskal-Wallis test. The results showed that only the risk variable had a significant difference, while the return and relative risk did not have a significant difference among the three instruments.

The next research was written by Meiyura and Azib (2020). This research is a type of quantitative research where the research stems from the emergence of a new type of investment sector (Cryptocurrency), in this study discusses the comparison of return and investment risk between gold and bitcoin. The sample used in this study is the purchase price of gold at PT Antam, Tbk, and the value of bitcoin against the Indonesian rupiah for the period July 2016 - June 2019. The results of research conducted by Meiyura and Azib (2020) show that there are differences in investment return and risk between gold and bitcoin.

The next research was written by Lumbantobing and Sadalia (2021). This quantitative research stems from the emergence of a new type

of cryptocurrency investment. This study discusses the rate of return and risk of investment in the cryptocurrency, stock, and gold sectors. The samples used in this study are bitcoin-type cryptocurrencies, LQ45 stocks, and gold obtained from the site www.investing.com in the 2013-2019 period. The results of research conducted by Lumbantobing and Sadalia (2021), show that the level of profit provided by bitcoin-type cryptocurrencies is higher than other investment sectors such as stocks and gold, this is also in line with the level of risk possessed if investing in the cryptocurrency sector, where bitcoin has a higher level of risk compared to stocks and gold.

The next research was written by Ichsani and Pamungkas (2022). This research is a type of quantitative research where the research stems from the emergence of a new type of investment sector (Cryptocurrency), in the study aims to measure differences in return, risk and performance between cryptocurrency, JCI and Gold, where performance is measured using the Sharpe Index, Treynor Index and Jensen Index methods. The population used in the study was 5 populations namely; Bitcoin (BTC), Ethereum (ETH), Ripplecoin (XRP), JCI, and Gold. The results of research conducted by Ichsani and Pamungkas (2022), show that there are significant differences in risk variables, Sharpe Index, and Jensen Index. While on the return and Treynor Index, there is no significant difference.

The next research was written by Pratama (2023). This research was conducted to determine the best-performing investment instruments

in the Fourth Industrial Revolution by analyzing the performance of stocks, gold, and cryptocurrencies. The samples used in this study are the monthly closing prices of IDX30 stocks, gold, and cryptocurrency for the period January 2018 - December 2021. The results of the study by Pratama (2023), show that there is no significant difference between IDX30 stocks, gold, and cryptocurrency when measured by returns during non-crisis times while there is a significant difference in the returns of IDX30, gold, and cryptocurrency during the economic crisis.

The next previous research was written by Haanurat et al. (2021). This study discusses the comparison of the return value, risk, and coefficient of variation of conventional and Sharia stocks in LQ45 from 2016 to 2019. The results show that there is no significant difference in the return value of conventional and Sharia stocks in LQ45 from 2016 to 2019 because each company has almost the same characteristics in terms of obtaining the rate of return.

The next previous research was written by Chania et al. (2021). This research aims to analyze the risk and return of investing in Ethereum and LQ45 shares and to see the difference between LQ45 stock prices and Ethereum prices before and after the announcement of the Covid-19 pandemic in Indonesia. The research method uses the Kruskal-Wallis test and the Paired Sample t-test. The results of research conducted by Chania et al. (2021) show that the return on Ethereum and LQ45 shares did not have a significant difference, while the level of the risk between Ethereum

and LQ45 shares had a significant difference. For the price of Ethereum and LQ45 shares, there was a significant difference between before and after the Covid-19 pandemic was announced in Indonesia.

The next previous research was written by Riyadi et al. (2022). The approach used in this study is descriptive and quantitative with the number of samples taken based on several characteristics of 11 cryptocurrencies and 5 stock indices spread across Indonesia. The analytical tools used in this study are methods of measuring returns, standard deviations, and value at risk (VaR) which are processed using Microsoft Office Excel. The results of this study show that the return and risk of investing in all 11 cryptocurrencies tend to be higher than the return and risk of investing in stock indices.

The next previous research was written by Kuncara and Anugrah (2023), cryptocurrencies such as Bitcoin, Ethereum and are high volatility digital commodities, so using them as an alternative to trading investments is very dangerous. Volatility analysis, portfolio formation, and implementation forecasting need to be done to minimize risk level and risk management to help investors/traders make decisions. The authors estimating its use is suitable for analyzing cryptocurrency returns and volatility. The methods used in this study are the method of converting data into returns, constancy detection with the ADF test, and normality test with the JarqueBera test. The result of this study is that there is a difference in the level of return on Bitcoin and Ethereum coins every year, both crypto

coins have experienced a very significant increase from before the covid 19 pandemic to covid 19.

This study differs from earlier research in that the latter research solely examined the variations in risk and return on investment instruments in cryptocurrency, foreign exchange, and gold without looking at the variations in volatility of those three virtual currencies. While the difference in cryptocurrency volatility before and after the covid 19 pandemic with the return method was carried out by Kuncara & Anugrah (2023).

2.3 Research Hypotheses

Based on the theoretical studies above, the hypotheses in this study are:

2.3.1. The Effect of Market Volatility of Cryptocurrency on ROI

According to the Efficient Market Hypothesis (EMH) Theory, the asset price always takes into account all relevant information. Even when prices are reacting to new information, the degree of price variation- can still have a detrimental impact on return on investment, particularly in markets like bitcoin where prices are extremely unpredictable ROI, even in a cryptocurrency market that operates efficiently. There is a positive association between market returns and cryptocurrency volatility based on high-frequency trading data. This finding contradicts conventional financial theories, which hold that volatility should grow more in response to negative returns than

positive returns (Brini & Lenz, 2024). Based on the discussion presented above, the following hypothesis is formulated:

H₁: Market volatility of cryptocurrency has a negative effect on return on investment

2.3.2. The Effect of Market Volatility of Foreign Exchange on ROI

The Efficient Market Hypothesis states that asset prices in financial markets are efficient when they fully incorporate all available information. In response to news about the economy, politics, and particular markets, price discovery is inherently characterized by volatility, which is a measure of price variation. According to the Efficient Market Hypothesis (EMH), excessive volatility makes it difficult for traders and investors to continuously generate profits, even though it can be considered as a normal aspect of the price adjustment process in reaction to new information.

The Indonesian foreign exchange market, structural flaws, and heteroscedastic city were factors in the inefficiencies of the market. About half of the analyzed foreign exchange rates do not support the efficiency hypothesis, which suggests that volatility may result in mispricing and profitable opportunities (Iyke, 2019). Based on the discussion presented above, the following hypothesis is formulated:

H₂: Market volatility of forex exchange has a negative effect on return on investment

2.3.3. The Effect of Market Volatility of Gold on ROI

The Efficient Market Hypothesis states that prices of assets in an efficient market consider all available information, and new information is promptly reflected in the price of the item. Volatility in the gold market refers to price movements brought on by adjustments to the macroeconomic environment, developments in world politics, or modifications in investor attitude. Although a certain amount of volatility is necessary for price discovery, excessive volatility can pose hazards and make it harder for investors to make steady profits. Volatility during these periods causes erratic price swings that could reduce investors' return on investment.

The impact of several volatility indices on gold prices both before and after the COVID-19 epidemic was examined in a study. It was discovered that during times of high volatility, particularly in financial markets, gold's ability to act as a hedge asset diminishes, impacting both its price and return on investment (ROI). The study showed that negative volatility in other markets can have a long-term negative impact on gold prices using a nonlinear autoregressive distributed lag technique (Islam et al., 2020). Based on the discussion presented above, the following hypothesis is formulated:

H₃: Market volatility of gold has a negative effect on return on investment.

2.4 Research Framework

The purpose of this study is based on the Efficient Market Hypothesis, which describes how market volatility and Return on Investment relate to three asset classes: gold, foreign exchange, and cryptocurrencies. On the other hand, high volatility reduces ROI by introducing risk and uncertainty. Volatility is defined as changes in market prices, and ROI is the profitability that is impacted by these changes. In cryptocurrency markets, extreme volatility makes returns unpredictable, reducing ROI. Similarly, in forex, even though prices reflect information efficiently, heightened volatility lowers the consistency of returns. Gold, often seen as a safe-haven asset, also faces significant volatility during economic instability, which can negatively impact ROI due to unpredictable price movements. In conclusion, the framework posits that market volatility, while reflective of information, has a negative effect on ROI across cryptocurrency, forex, and gold, as excessive volatility increases uncertainty, making it difficult for investors to achieve stable returns. From the explanation above, a research framework can be created that reflects the influence of market volatility of cryptocurrency, foreign exchange, and gold toward ROI.

From the theoretical basis that has been disclosed, it is depicted in a research framework that is arranged as shown in Figure 2.1

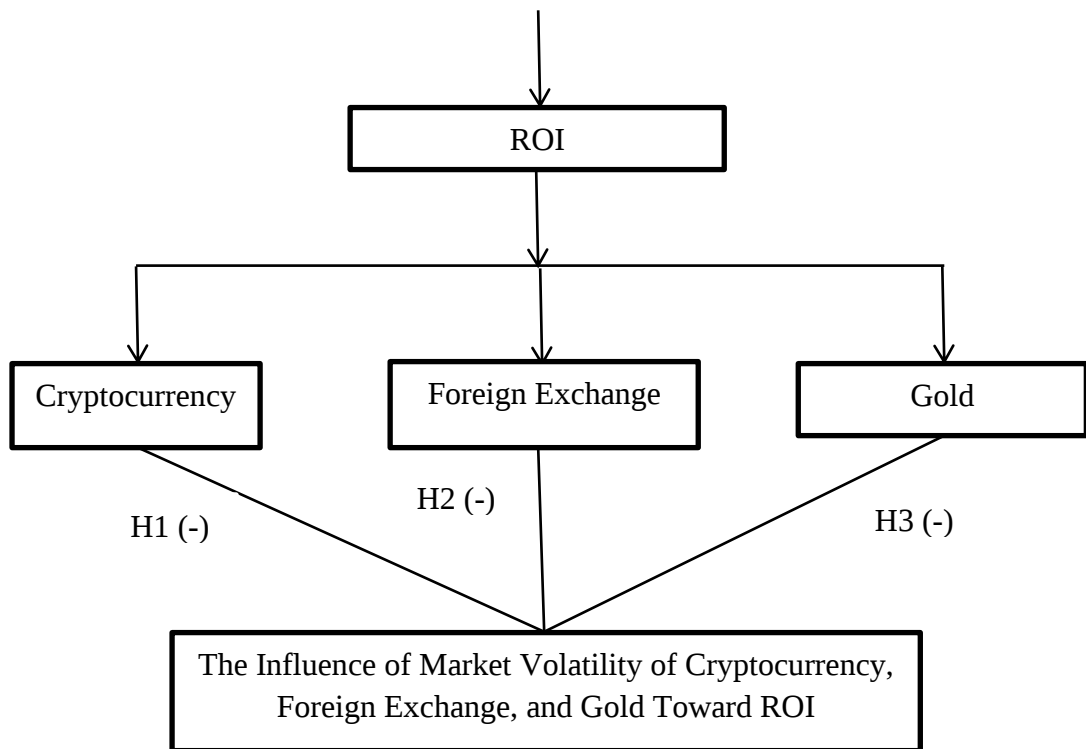

Figure 2. 1 Research Framework

CHAPTER III

RESEARCH METHOD

This section describes the population and research samples, types of data and their sources, how to measure research variables, and data analysis techniques used.

3.1 Research Population and Sample

The population of this study is the monthly closing price of cryptocurrencies, gold, and the monthly closing price of forex on the Indonesian market from 2019 to 2023. As one of the largest and best-selling cryptocurrencies in the market today, Bitcoin was selected as a sample of the cryptocurrency population. Bitcoin data will be taken from the investing.com website. Gold data will be taken from the investing.com and Pegadaian websites. As a sample of the forex, the US dollar was chosen because it is the most in-demand currency in the money market and the easiest to buy and sell. Foreign exchange data will be taken from the investing.com website.

3.2 Types and Sources of Data

The type of data used in this study is secondary data, namely in the form of historical data on the development of Bitcoin prices, the development of US dollar prices, and gold taken from the site <https://www.investing.com/> during the 2019-2023 period.

3.3 Variable Measurement

Variable measurement is the process of determining the amount or strength of information about certain individuals, events, ideas, and/or objects and their relationship to business problems or opportunities. Return on Investment, Return, and Volatility of three instrument (cryptocurrency, foreign exchange, and gold) are used to measure the variables in this study.

3.3.1. Return on Investment

In this study, the way to measure the return on investment that will be received during the period uses the following formula:

$$ROI = \frac{NP}{CoI} \times 100$$

Description:

ROI : Return on Investment

NP : Net Profit

CoI : Cost of Investment

3.3.2. Volatility of Cryptocurrency

In this study, the way to measure the volatility of cryptocurrency that will be received during the period uses the following formula:

$$Vc = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (R_i - \bar{R})^2}$$

Description:

Vc : Volatility Cryptocurrency

R_i : $\ln\left(\frac{P_i}{P_{i-1}}\right) \longrightarrow$ Logarithmic Daily Return

$\bar{R}$: Average Daily Return

n : Number of Observations (days)

P_i : Price of Cryptocurrency on Day i

P_{i-1} : Price of Cryptocurrency on Previous Day

3.3.3. Volatility of Foreign Exchange

In this study, the way to measure the volatility of foreign exchange that will be received during the period uses the following formula:

$$Vf = \sqrt{\frac{1}{n-1} \sum_{i=1}^n \left(\ln\left(\frac{E_i}{E_{i-1}}\right) - \bar{R} \right)^2}$$

Description:

Vf : Volatility of Foreign Exchange

E_i : Exchange Rate on Day i (e.g., USD/IDR)

E_{i-1} : Exchange Rate on Previous Day

$\ln\left(\frac{E_i}{E_{i-1}}\right)$: Log Return of Exchange Rate

$\bar{R}$: Average Log Return Over The Period

n : Number of Observations (days)

3.3.4. Volatility of Gold

In this study, the way to measure the volatility of gold that will be received during the period uses the following formula:

$$Vg = \sqrt{\frac{1}{n-1} \sum_{i=1}^n \left(\ln\left(\frac{P_i}{P_{i-1}}\right) - \bar{R} \right)^2}$$

Description:

V_g : Volatility of Gold
 P_i : Gold Price at Day i
 P_{i-1} : Gold Price at the Previous Day
 $\ln\left(\frac{P_i}{P_{i-1}}\right)$: Daily Logarithmic Return
 $\bar{R}$: Average Daily Return over n periods
 n : Number of Observations (days)

3.4 Data Analysis Method

The purpose of this data analysis is to determine how each independent variable affects the dependent variable. Hypotheses were tested using the SPSS version 30 program and Excel 2019. Multiple regression analysis was used to determine the relationship between the independent variable and the dependent variable. Before the regression test is performed, the data is tested with the classical assumption test: autocorrelation, heteroscedasticity, normality, and multicollinearity.

3.4.1 Descriptive Statistics

Descriptive statistics refers to data analysis methods that are used to characterize and enumerate the fundamental properties of the acquired data. Without drawing additional conclusions, descriptive statistics assist researchers in recognizing patterns, trends, and distributions in data (Saunders et al., 2019).

3.4.2 Classical Assumption Test

Multiple linear regression testing can be carried out after the model in this study meets the requirements to pass the classical

assumption test, and multiple linear regression testing can be carried out. Data must be normally distributed and not contain heteroscedasticity or multicollinearity. Before conducting multiple linear regression testing, conventional assumption testing must be carried out, which consists of the following tests.

a. Normality Test

According to Ghozali (2021), the normality test is a procedure for evaluating whether the distribution of data in a dataset is close to a normal distribution. Normality is one of the basic assumptions in many statistical techniques, which if not met, can affect the validity of the analysis results. One Sample Kolmogorov Smirnov can be used to test the normality of data, with the assumption that a significant value above 0.05 indicates that the data is normally distributed, and a significant value below 0.05 indicates that the data is not normally distributed (Ghozali, 2021).

b. Multicollinearity Test

The purpose of multicollinearity testing is to determine whether there is a correlation between the independent variables in the regression model. This multicollinearity results in a sample with many variables. Since it shows a large standard error, the t-count will be smaller than the t-table when the coefficients are tested. This indicates that there is no linear

relationship between the affected independent variable and the dependent variable.

The tolerance value and variation factor inflation (VIF) value can be used to determine whether there is multicollinearity in the regression model. The tolerance value indicates the variability of certain independent variables that cannot be explained by other independent variables. Therefore, a high VIF value equals a low tolerance value, which indicates high collinearity because $VIF = 1/\text{tolerance}$. A tolerance value of 0.10 or a VIF value above 10 are commonly used cut-off values (Ghozali, 2021).

c. Heteroscedasticity Test

The heteroscedasticity test is a statistical technique used to determine whether the variance of the residuals (errors) in a regression model remains constant (homoscedasticity) or changes (heteroscedasticity) across a range of independent variable values. Otherwise, the regression model estimation results are inefficient, and the statistical test is invalid. A good model is one without heteroscedasticity (Ghozali, 2021).

d. Autocorrelation Test

According to Ghozali (2021), the autocorrelation test is a statistical technique used to determine whether there is a correlation in the residuals, or error terms, of a regression

model. Autocorrelation occurs when the residuals of a regression model are related to each other and not independent of each other over time. Autocorrelation can lead to inaccurate regression coefficient estimates and invalid statistical tests. A good regression model is free from autocorrelation.

The Run Test, which is part of non-parametric statistics, can be used to determine whether there is a high correlation between residuals. If there is no correlation between residuals, then the residuals are random. The run test is performed by making a basic hypothesis, namely: H_0 : residuals (res_1) are random, or H_A : residuals (res_1) are not random. With this basic hypothesis, the basis for making statistical test decisions with the run test is (Ghozali, 2021):

1. If the value of Asymp. Sig. (2-tailed) is less than 0.05, H_0 is not supported and H_A is supported. This indicates that the residual data occurs systematically and is not random.
2. The value of Asymp. Sig. (2-tailed) value greater than 0.05 indicates that H_0 is supported, and H_A is not supported. This indicates that the residual data is random.

3.5 Simple Regression Analysis

In this study, the data analysis technique used simple linear regression, which is an analysis technique to determine the effect of the independent variable on the dependent variable. The models in this study are:

$$ROI = \alpha_0 + \beta CV + \beta FV + \beta GV + \epsilon$$

Description:

ROI : Return On Investment

α_0 : Constant

CV : Cryptocurrency Volatility

FV : Foreign Exchange Volatility

GV : Gold Volatility

ϵ : Error terms

3.6 Hypotheses Tests

Statistically, at least this hypothesis testing can be measured from the F statistical value and the t statistical value.

a. F test

The F test is used to test whether the regression model provides a significant explanation of data variability compared to a model that has no independent variables (Ghozali, 2021). The purpose of this test is to ascertain whether the independent and dependent variables have a meaningful relationship. A

significant F-Statistic means that the model has a good goodness of fit, meaning it significantly explains the variability of the dependent variable. For this study, a significance level of 0.05 was used, with degrees of freedom. The decision criteria are as follows:

1. The model fit test is rejected if α is more than 0.05.
2. The model fit test is accepted if α is less than 0.05.

b. t-test

According to Ghazali (2021), if the other independent variables are held constant, the t-test determines whether the regression coefficient of a particular independent variable in a multiple regression model is statistically significant. It also helps determine whether the independent variable being tested has a significant influence on the dependent variable. In this study, a significance level of 0.05 is used. The decision criteria are as follows:

1. The model fit test is rejected if α is more than 0.05.
2. The model fit test is accepted if α is less than 0.05.

c. R-square Test

According Ghazali (2021), The degree to which the model can account for changes in the dependent variable is indicated by the coefficient of determination (R^2). Nearly all of the information required to predict the variation in the dependent

variable is provided by the independent variables, as indicated by an R² value near 1.

3.7 Operational Hypothesis

Ho1 = The market volatility of cryptocurrencies has no negative effect on ROI.

Ha 1 = The market volatility of cryptocurrencies has a negative effect on ROI.

Ho 2 = The market volatility of foreign exchange has no negative effect on ROI.

Ha 2 = The market volatility of foreign exchange has a negative effect on ROI.

Ho 3 = The market volatility of gold has no negative effect on ROI.

Ha 3 = The market volatility of gold has a negative effect on ROI.

This study uses a significance value of 5% with the following criteria:

- a. If the p-value (significance) < 0.05 , then H₀ is not supported, and H_a is supported.
- b. If the p-value (significance) > 0.05 , then H₀ is supported, and H_a is not supported.

CHAPTER IV

DATA ANALYSIS AND DISCUSSION

This chapter discusses the result and analysis of the research that examines the effect of influence market volatility of cryptocurrency, foreign exchange, and gold toward ROI.

4.1 Descriptive Analysis

Table 4. 1 Descriptive Analysis Result

		N	BITCOIN	DOLLAR	GOLD
ROI	MAX	60	0.000052%	0.083865%	0.004961%
	MIN	60	-0.000024%	-0.059148%	-0.003537%
	MEAN	60	0.000003%	0.000764%	0.000379%
	ST. DEV	60	0.000012%	0.017497%	0.001656%

Based on table 4.1 above, the average value of Bitcoin ROI is very small (0.00003%) with a standard deviation that is also small (0.000012%). This indicates low volatility in returns, with a small range of values between minimum and maximum. Meanwhile, the average value of Dollar ROI is larger than Bitcoin (0.000764%) and the standard deviation is quite high (0.017497%). This indicates higher volatility which means Dollar's returns have greater fluctuations than Bitcoin. And for Gold ROI average value (0.000379%) and standard deviation (0.001656%) which puts it in between bitcoin and Dollar in terms of volatility. Its return range is narrower than that of the Dollar, and shows moderate fluctuations.

4.2 Classical Assumption Test

4.2.1. Normality Test

The purpose of normality testing is to determine whether or not the data is near or follows a normal distribution. The Kolmogorov-Smirnov quantity was examined using SPSS in order to perform normality testing in this study. The following are the normalcy test results:

Table 4. 2 Normality Test Result

Kolmogorov-Smirnov Test			
	ROI Bitcoin	ROI Dollar	ROI Gold
Sig	0.001	0.008	0.004

The ROI of the three instruments (Bitcoin, Dollar, and Gold) has a significance value of less than 0.05, as can be seen in the above table. If this value is less than the designated significance value, it can be inferred that the data under investigation are not normally distributed, and non-parametric techniques will be used if necessary for additional analysis.

4.2.2. Multicollinearity Test

Multicollinearity testing is used to determine whether there is a perfect link between the independent variables. Multicollinearity conditions affect a regression model if there is a strong linear relationship between two or more independent variables. When there is multicollinearity in the regression model, several of the variables

may create comparable parameters, which may cause them to interfere with one another. The following are the findings of the multicollinearity test:

Table 4. 3 Multicollinearity Test Result

Multicollinearity Test			
		Collinearity Statistic	
Market Volatility	Sig	Tolerance	VIF
Bitcoin	< .001	0.932	1.073
Dollar	< .001	0.811	1.233
Gold	< .001	0.856	1.168

From the table above, the VIF analysis carried out in testing multicollinearity in this study, all variables have a tolerance value greater than 0.1 and VIF smaller than 10, which means there is no multicollinearity problem.

4.2.3. Heteroscedasticity Test

The goal of heteroscedasticity testing is to ascertain whether a data set deviates from the traditional heteroscedasticity assumption, which states that there should be inequality of variance from residuals for every observation in the regression model. The following are the findings of the heteroscedaticity test:

Table 4. 4 Heteroscedasticity Test Result

Heteroscedasticity Test	
Abs_Res	Sig
Bitcoin	0.743

Dollar	0.651
Gold	0.463

From the table above, the Bitcoin variable test above obtained a significance value of 0.743 greater than 0.05, which means that there is no heteroscedasticity problem. Testing the Dollar variable above obtained a significance value of 0.651 greater than 0.05 which means there is no heteroscedasticity problem. And testing the Gold variable above obtained a significance value of 0.463 greater than 0.05 which means there is no heteroscedasticity problem.

4.2.4. Autocorrelation Test

To ascertain whether there is a deviation in the correlation between the residuals in one observation and other data in the regression model, autocorrelation testing is performed. The Run test value obtained can be used to determine whether autocorrelation exists in the regression equation. The following are the test results:

Table 4. 5 Autocorrelation Test Result

Run Test	
Abs_Res	Asymp.Sig (2-tailed)
Bitcoin	0.602
Dollar	0.795
Gold	0.795

From the table above, it shows that each p-value of 0.602, 0.795, and 0.795 is greater than 0.05 so it is concluded that there is no autocorrelation.

4.3 Multiple Regression Analysis

Table 4. 6Analysis Multiple Regression

Multiple Regression Test							
	Unstandardized Coefficients		Standardized Coefficients Beta			Collinearity Statistics	
	β	Std. Error		t	Sig	Tolerance	VIF
α_0	0.021	0.000	-	483.937	<.001	-	-
Bitcoin	0.067	0.000	1.016	1502.676	<.001	0.932	1.073
Dollar	0.006	0.000	0.089	122.188	<.001	0.811	1.233
Gold	0.000	0.000	0.007	10.584	<.001	0.856	1.168

According to the research, the regression model's constant has a value of 0.021 at a significance level of less than 0.001. This shows that the constant value still has a base value of 0.021 even if the volatility of Bitcoin, Forex, and gold remains constant (worth zero). In other words, ROI might be influenced by variables not included in the model.

Of the three independent variables evaluated, Bitcoin volatility has the most prominent influence on ROI, as evidenced by its regression coefficient of 0.067 and t-statistic value of 1502.676. The highly

significant impact of Bitcoin volatility on ROI is indicated by the significance value of less than 0.001. This indicates that ROI will rise by 0.067 for every standard unit increase in Bitcoin volatility. In addition, the standardized Beta value of 1.016 suggests that Bitcoin has a relatively large influence on this model compared to other variables.

In addition, albeit not as much as Bitcoin, Forex volatility also affects ROI. The t-statistic is 122.188, the regression coefficient is 0.006, and the significance value is less than 0.001. This demonstrates that, while not as much as Bitcoin, Forex volatility has a considerable impact on ROI. ROI will rise by 0.006 for every standard unit increase in Forex volatility.

However, with a regression coefficient of just 0.000, gold volatility has a negligible impact on ROI. Nonetheless, despite its minor impact, gold volatility still has a substantial link with ROI, as indicated by the t-statistic value of 10.548 and significance <0.001 . This indicates that Bitcoin and Forex have a greater impact on ROI than fluctuations in gold volatility.

Furthermore, the findings of the multicollinearity study demonstrate that the independent variables in this model do not have a high correlation issue. Variance Inflation Factor (VIF) values (Bitcoin: 1.073, Forex: 1.233, Gold: 1.168) are below 10 and tolerance levels for all variables are over 0.1. This indicates that there is no distortion in the regression findings because there is not a high correlation between any of the independent variables.

In contrast to dollars and gold, Bitcoin has a substantial and stronger impact on return on investment, according to the above figure. The model demonstrates that the volatility of gold, dollars, and bitcoin all have a major impact on ROI, with bitcoin having the most impact.

4.4 Hypothesis Test

4.4.1. T-test

Table 4. 7 t-test

t-statistical			
	Bitcoin	Dollar	Gold
t-test	1502.676	122.188	10.548
sig	< .001	< .001	< .001

Based on the table above, the information can be obtained, namely:

1. Bitcoin volatility has a significant value of 0.001, where the value of $0.001 < 0.05$. So it can be concluded that H_{01} is rejected and H_{a1} is accepted. That is the market volatility of cryptocurrencies has a negative effect on ROI.
2. Dollar volatility has a significant value of 0.001, where the value of $0.001 < 0.05$. So it can be concluded that H_{02} is rejected and H_{a2} is accepted. That is the market volatility of foreign exchange has a negative effect on ROI.
3. Gold volatility has a significant value of 0.001, where the value of $0.001 < 0.05$. So it can be concluded that H_{03} is

rejected and Ha3 is accepted. That is the market volatility of gold has a negative effect on ROI.

4.4.2. F-test

Table 4. 8 F-test

F-statistical			
	Bitcoin	Dollar	Gold
F-test	7201.562	1.239	0.273
Sig	< .001	0.270	0.603

Based on the table above, the information can be obtained, namely:

1. Bitcoin volatility has a significant value of < 0.001 , where $< 0.001 < 0.05$. So it can be concluded that Ho1 is rejected and Ha1 is accepted. That is, the market volatility of cryptocurrencies has a negative effect on ROI.
2. Dollar volatility has a significant value of 0.270, where $0.270 > 0.05$. So it can be concluded that Ho2 is accepted and Ha2 is rejected. That is, the market volatility of foreign exchange has no negative effect on ROI.
3. Gold volatility has a significant value of 0.603, where $0.603 > 0.05$. So it can be concluded that Ho3 is accepted and Ha3 is rejected. That is, the market volatility of gold has no negative effect on ROI.

4.4.3. R Square

Table 4. 9 R² - test

R ² - Statistical			
	Bitcoin	Dollar	Gold
R ²	0.99201	0.02091	0.00468

Based on the table above, the information can be obtained, namely:

1. The volatility of bitcoin has a significant impact on ROI, with a value of $R^2 = 0.99201$ (99.2%). This indicates that Bitcoin volatility accounts for nearly all of the fluctuation in ROI, with other factors influencing only 0.8%. This demonstrates that Bitcoin is the financial instrument with the strongest correlation to ROI in this model, with variations in ROI being mostly determined by its volatility.
2. With a value of $R^2 = 0.02091$ (2.09%), dollar volatility has a negligible impact on return on investment. To put it another way, dollar volatility only accounts for only 2.09% of the fluctuation in ROI, the majority is driven by variables not included in this model.
3. With a value of $R^2 = 0.00468$ (0.468%), gold volatility demonstrates that changes in the price of gold hardly explain ROI. Gold volatility has a negligible impact and is therefore not a significant determinant of ROI in this study.

4.5 Hypothesis Discussion

4.5.1. Market volatility of cryptocurrency has a negative effect on return on investment

The test results of the first hypothesis (H1) show that the market volatility of cryptocurrency (bitcoin) has a significant negative effect on return on investment (ROI). The t value of 1502.676 at a significance threshold of $p < 0.001$ supports this, showing that ROI is statistically strongly impacted by bitcoin volatility. The F test results, which show that the regression model for cryptocurrencies is generally significant with a F value of 7201.562 and a significant p-value of less than 0.001 support this. These outcomes can be explained by the extremely fluctuating character of the bitcoin market, which is frequently impacted by governmental legislation, speculation, and world economic events. Because of the considerable price instability, this volatility raises risk and may reduce return on investment.

The Efficient Market Hypothesis Fama (1970), which holds that financial asset prices efficiently reflect all available information, is consistent with this outcome. High volatility, on the other hand, indicates that the market is not entirely efficient in the case of cryptocurrencies because of asymmetry in information and speculation. According to Aryadwithya (2022), inadequate liquidity and inexperienced regulation are the main causes of cryptocurrency market volatility, which has a detrimental effect on return on

investment. Additionally, Meiyura and Azib (2020) noted that because cryptocurrency is speculative, it is hard to forecast prices, which increases investment risk. According to research by Lumbantobing and Sadalia (2021), cryptocurrency volatility is typically higher than that of traditional assets, which lessens its appeal as a long-term investment vehicle.

This findings is in line with earlier research by Brini and Lenz (2024), who came to the conclusion that investors could suffer from significant cryptocurrency market volatility because of the high level of uncertainty. Investors are therefore advised to diversify their holdings and use caution when putting money into cryptocurrencies, particularly in times of market volatility. The results reinforce the case for researchers and scholars that understanding bitcoin volatility is crucial to making better financial decisions.

4.5.2. Market volatility of forex exchange has a negative effect on return on investment

The results of the second hypothesis test (H2) show that the foreign exchange volatility market (Dollar) has a negative and insignificant effect on return on investment (ROI). With a t-value of 122.188 and a significance level of $p < 0.001$, the t-test results demonstrate that foreign exchange market volatility significantly reduces ROI. The entire regression model is not significant to explain

this link, according to the F-test findings, which show an F-value of 1.239 with a significance level of $p = 0.270$.

Exchange rate uncertainty, which is frequently impacted by global macroeconomic issues including interest rates, trade policies, and political stability, can be used to explain the significant negative effect discovered by the t-test. Exchange rate risk frequently affects investors in foreign exchange-based transactions, which could lower return on investment. However, the F-test's insignificance might indicate that there are additional factors influencing this relationship that the model does not fully account for, including interest rates or local market circumstances.

The Efficient Market Hypothesis Fama (1970) stated that currency rates should represent all available information yet, in reality, unpredictable volatility is caused by outside variables such central bank intervention and geopolitical unpredictability. According to Ichsani and Pamungkas (2022), exchange rate volatility is exacerbated by global economic uncertainty, which has a detrimental effect on ROI stability. Additionally, Pratama (2023) said that market sentiment and monetary policy have an impact on foreign exchange volatility, making it harder to forecast than other assets.

This outcome is consistent with Iyke (2019) research, which discovered that ROI stability is impacted by foreign exchange volatility, particularly in emerging economies. To lessen the effect of

exchange rate swings on their portfolios, investors are encouraged to employ risk mitigation strategies like futures or hedging. This study can add to the body of knowledge on foreign exchange market volatility and return on investment for scholars. Additionally, these findings can provide researchers with new avenues to investigate how foreign exchange fluctuation affects ROI in various contexts.

4.5.3. Market volatility of gold has a negative effect on return on investment.

The third hypothesis test results (H3) show that the gold volatility market has a negative and insignificant effect on return on investment (ROI). With a t-value of 10.548 and a significance threshold of $p < 0.001$, the t-test results demonstrate that the volatility of the gold market significantly reduces ROI. The total regression model is not significant, according to the F test, which yields a F value of 0.273 with a significance level of $p = 0.603$. The t-test's strong negative effect shows that changes in the price of gold can have an impact on investment returns, particularly in the near term. Interest rate policy, fluctuating market demand, and uncertainties in the global economy all frequently affect the price of gold. The F-test's insignificance suggests that this link might not be robust generally and that other factors, such inflation or geopolitical stability, have a greater impact on gold ROI.

According to the Efficient Market Hypothesis Fama (1970), gold prices ought to represent all available information; yet, in some circumstances, they are also impacted by outside variables like demand worldwide and central bank policies. According to Haanurat et al. (2021), even though gold is frequently seen as a safe haven, its return on investment (ROI) can decrease in times of extreme volatility. Chania et al. (2021), changes in interest rates and monetary policy have a significant impact on gold's volatility, which might lessen its appeal as an investment asset. Additionally, Riyadi et al. (2022) said that gold still involves a high level of risk even if it typically has less volatility than cryptocurrencies and currency.

This result validates the findings of Islam et al. (2020), who discovered that even while gold has a low volatility, it can nevertheless negatively affect return on investment, particularly when the market is volatile. It is recommended that investors avoid relying too heavily on gold in their portfolios and instead see it as a long-term hedging tool. These findings provide scholars and researchers with new avenues for investigating variables that impact the volatility of the gold price, such as changes in monetary policy, worldwide economic conditions, or geopolitical factors. More intricate models that forecast the effect of gold volatility on return on investment under various market conditions can be created through further research.

Additionally, in light of the volatility of supposedly safe assets like gold, this study significantly advances investment theory.

CHAPTER V

CONCLUSION AND RECOMMENDATION

5.1. Conclusions

This study aims to determine the influence of market volatility of cryptocurrency, foreign exchange, and gold toward return on investment (ROI). This research uses a quantitative approach using secondary data, namely in the form of historical data on the development of bitcoin prices, the development of US dollar prices, and gold during the 2019-2023 period and closing data in December 2018. From this period, 60 monthly closing price data for each variable were obtained. Based on the analysis, hypothesis testing, and interpretation of the previously discussed results, the following conclusions can be obtained:

1. Market volatility of cryptocurrency has a negative and significant effect on return on investment. With this finding, it can be seen that market volatility of cryptocurrency can affect on return on investment.
2. Market volatility of foreign exchange has a negative and insignificant effect on return on investment. With this finding, it can be seen that market volatility of foreign exchange can affect partially on return on investment.
3. Market volatility of gold has a negative and insignificant effect on return on investment. With this finding, it can be

seen that market volatility of gold can not influence on return on investment.

5.2 Research Implications

The literature on the connection between market volatility and return on investment, particularly in cryptocurrency, foreign exchange, and gold, is anticipated to grow as a result of this study. Investors can use it to better manage their portfolios by gaining a better understanding of the risks associated with market volatility. In addition, this research is also expected to be a reference for further researchers who are interested in conducting similar research in the future.

This research has several implications, namely:

1. For Investor

When selecting highly volatile financial products like gold and cryptocurrency, investors must exercise greater caution. Diversifying your portfolio is a crucial step in lowering the risks associated with market volatility.

2. For Academic

This study offers a theoretical foundation for future research on how market volatility affects investment in developing nations like Indonesia. Academic can expand on this study by include more pertinent variables, such macroeconomic considerations.

5.3 Limitations

In this study there are some limitations, among others:

1. In this study, researcher only used monthly closing data in 2018-2023 as the object of research.
2. In this study, researcher only used three instruments to determine their influence on market volatility, namely cryptocurrency, foreign exchange, and gold.
3. In this study, researcher only used simple methods such as calculating the standard deviation of return on investment (ROI) to measure market volatility.

5.4. Future Research

Some recommendations for future researchers are in the following:

1. Future research is recommended to conduct a longer period span in order to see a more detailed comparison of the influence of cryptocurrency, foreign exchange and gold market volatility or can examine daily closing data from the same period range.
2. Future research is recommended not only to look at the effect of market volatility on three instruments only, but can add other comparative instruments such as looking at the effect of market volatility on other types of cryptocurrency and foreign exchange investment instruments, namely: Ethereum and Japanese yen

3. Future research is expected to use the ARCH/GARCH model or use other statistical approaches to evaluate market volatility more accurately.
