## ACKNOWLEDGMENTS

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

*Assalamualaikum Wr. Wb.*

*Alhamdulillah rabbil'alamin*, the researcher feels gratitude to Allah SWT, because of His blessing and grace, the researcher can complete writing the thesis with the title "THE ANALYSIS OF FASHION-ORIENTED IMPULSE BUYING ON COLLEGE STUDENTS". This thesis writing is one of the requirements to complete the study and to get an undergraduate degree in Marketing Study, Department of Management, Faculty of Economics, Universitas Islam Indonesia.

The preparation of this research is not separated from the encouragement and the support from several parties. In this occasion, the researcher wants to give his gratitude to the following:

1. Allah SWT, for all Your Kindness, Mercy, and Lessons that You always give to me.
2. Prophet Muhammad SAW, for being a great figure as the Last Prophet and making this life becomes better than before.
3. Mr. Anas Hidayat, Drs., M.B.A., Ph.D. as the Head of Business and Economics Department, International Program UII and Mr. Rokhedi Priyo Santoso, S.E., MIDEc., as the Deputy Head of Business and Economics Department, International Program UII.
4. Raden Roro Ratna Roostika, S.E., MAC., [Ph.D.](#) as the Content Advisor that

has provided time, energy, and thought in giving a direction in the thesis preparation.

5. Ms. Alfi Zakiya, S.Kom., S.Pd. as the language advisor who has provided time, energy, and willingness to correct my grammar.
6. Mr. Anas Hidayat, Drs., M.B.A., Ph.D. as the examiner for thesis exam who has provided suggestion and advice to my thesis.
7. My Family who always support me whenever and wherever I need. My mother and father, Riyanti Dwi Nastiti and Suhardianto for the life guidance. My beloved sisters, Fahanny and Fahaliza for always being there when I need someone to joke with. Thank you for your unconditional love.
8. My broskies, xFBCx. Augi, Fatra, Gifi, and Lukas who always support me, and also trash talk me.
9. Seta, Avi, Robot, Serge, Agiv, Fajar, Ayang, Beruk, Nur, Midut, Hanif. Thank you for making my Uni life feels much more fun.
10. All of IP Management 2013 students: Adhiya, Miftah, Budi, Alma, Anan, Annis, Seta, Astrid, Asya, Avi, Agiv, Dhito, Citra, Dina, Batman, Ayang, Robot, Hady, Henry, Ayik, Upit, Nur, Midut, Serge, Roppun, Winny. Thank you for the togetherness and cheerfulness during this time.
11. All members of International Buddy, MARCOMM IP UII, and OMT Facilitators that have worked together with me.
12. Furthermore, great thanks dedicated for all of you who always give me support, help and pray for all this time, so that I can complete this thesis.

This research is not perfect yet but hopefully, this research may be useful for the management study, especially in marketing study.

*Wassalamualaikum Wr. Wb.*

Yogyakarta, February 12<sup>th</sup>, 2018

# THE ANALYSIS OF FASHION-ORIENTED IMPULSE BUYING ON COLLEGE STUDENTS

Dyan DD Muhammad  
Faculty of Economics and Business Universitas Islam Indonesia  
dyanddm@gmail.com

## ABSTRACT

The aim of this research was to determine the role of fashion involvement, positive emotion, and hedonic consumption in explaining college students' fashion-oriented impulse buying toward fashion products. This research was conducted in Indonesia. The sample of the research was college students who follows fashion trend and have experiences regarding impulse buying. The data was collected by using questionnaire based on Likert scale. The method of sample was purposive sampling with 219 respondents that were chosen to represent overall users. The data was analyzed by using Structural Equation Modeling analysis with the help of SPSS and AMOS. The result of this research showed that there were positive influences both directly and indirectly on fashion involvement toward fashion-oriented impulse. There were positive influence of positive emotion and hedonic consumption as mediating variables toward fashion-oriented impulse buying.

**Keyword:** *Fashion Involvement, Positive Emotion, Hedonic Consumption, Fashion-oriented Impulse Buying*

# **ANALISIS FASHION-ORIENTED IMPULSE BUYING TERHADAP MAHASISWA**

## **ABSTRAK**

Tujuan dari penelitian ini adalah untuk mengetahui peran keterlibatan fashion, emosi positif, dan konsumsi hedonis dalam menjelaskan perilaku impulse buying mahasiswa terhadap produk fashion. Penelitian ini dilakukan di Indonesia. Sampel penelitian adalah mahasiswa yang mengikuti perkembangan fashion dan pernah mengalami impulse buying. Data dikumpulkan dengan menggunakan kuesioner berdasarkan skala Likert. Metode sampel menggunakan purposive sampling dengan 219 responden yang dipilih untuk mewakili keseluruhan pengguna. Data kemudian dianalisis dengan menggunakan analisis Structural Equation Modeling dengan bantuan SPSS dan AMOS. Hasil penelitian ini menunjukkan bahwa keterlibatan fashion berpengaruh positif baik secara langsung maupun tidak langsung pada impulse buying, terdapat dampak positif pada emosi positif dan konsumsi hedonis sebagai mediating variables terhadap impulse buying.

*Kata Kunci: Keterlibatan Fashion, Emosi Positif, Konsumsi Hedonis, Impulse Buying*

## **CHAPTER I**

### **INTRODUCTION**

#### **1.1. BACKGROUND**

As in many other countries in South East Asia, economic growth in Indonesia continues to be driven by private or household consumption (Sugandi, 2017). According to Indonesian Synthetic Fiber Producers Association (APSyFI), the purchasing power continues to increase, where textile consumption rose from 1.21 million tons in 2009 to 1.75 million tons in 2014, and encouraged by increases in population, consumer spending also caused by the increase in per capita consumption, which rose from 5.03 kg in the year 2009 to 6.82 kg in the year 2014 (Maizer, 2016). This resulted in the growth of textile and fashion industry in Indonesia. Moreover, young consumer group have caught significance attention from marketers as their purchasing power and money attitude has been growing and changing (Schor, 1998). Therefore, the consumer behavior of young consumer group, college students, is worth to be researched also the vast rise of fashion trends and product has opened up an alternative for young consumer group to express themselves.

Nowadays, shopping is not only an activity to acquire necessary goods or to fulfill needs, instead shopping has become a leisure and lifestyle activity (Lury, 1996; Bayley and Nancarrow, 1998), it may also fulfill psychological needs (Dittmar,

Beattie, and Friese, 1996; Dittmar, 2005). Therefore, contrary to the 'rational economic man' view, it has been recognized that many consumer behaviors are not carefully considered at all. One particular spontaneous consumer style is known as impulse buying.

Impulse buying is a pervasive and distinctive lifestyle phenomenon that has been on a significant growth, thus; it received increasing attention from consumer researchers (Rook and Fisher, 1995). The increasing of personal disposable incomes and the availability of credit has made impulse buying behavior a common consumer behavior (Dittmar and Drury, 2000). Moreover, many store purchases are made when consumer follow their urge and give in to impulse buying (Underhill, 1999). Impulse buying behavior are more likely to occur when consumer evaluate their purchase which happened when consumer experienced an impulse buying stimulus (O'Guinn and Faber, 1989). Impulse buying has been suggested as an important field of study because of its powerful influence on consumer behavior (Bayley and Nancarrow, 1998 and Hausmann, 2000).

Researchers who studied impulse buying has been focused on defining the difference between impulse and non-impulse buying behavior (Cobb and Hoyer, 1986 and Piron, 1991). Many previous studies also provide theoretical framework for examining impulse buying related to psychological variables, hedonic experiences, and situational variables in shopping context (Beatty and Ferrell, 1998; Burroughs,

1996; Rook and Fisher, 1995; Park and Kim, 2008 and Herabadi *et al.*, 2009). Generally, researchers found that impulse buying satisfied hedonic or emotional needs for fun, social interaction, and gratification (Hausmann, 2000 and Piron, 1991).

Previous studies have implied that consumer impulse buying can be encouraged by a hedonic consumption tendency and emotional factors. An aligned issue with hedonic consumption is to determine product-specific impulse buying behavior. Jones *et al.* (2003) stated that product-specific impulse buying is affected significantly by product involvement and it is an important factor supporting impulse buying tendencies. Impulse buying of fashion products (e.g. clothing, apparel) shows a variety of pattern that include pure, reminded, emotional, and fashion-oriented impulse buying behaviors (Cha, 2001; Han *et al.*, 1991 and Ko, 1993).

Han *et al.* (1991) found that textile and clothing students had significantly higher impulse buying scores than students in other major. Thus, their findings clearly revealed that fashion-oriented impulse buying is related strongly to fashion involvement. It also supports the notion that sensory and experiential cues of fashion product might affect fashion involvement. Therefore, it encourages fashion-oriented impulse buying. Fashion-oriented impulse buying can also be predicted by hedonic consumption tendency (Hausmann, 2000) and positive emotion which occurs when shopping (Mattila and Enz, 2002; Herabadi *et al.*, 2009).

Sensory experiential products (e.g. apparel, accessories, jewelry) have a major role in symbolic interaction with consumers' hedonic or emotional experiences in market environments (Park *et al.*, 2006). The importance of experiential aspect of consumption shows that it is important for marketers to understand impulse buying behavior for fashion products from an experiential perspective.

This research explored a model of fashion-oriented impulse buying related to product involvement and experiential aspect of consumption including hedonic consumption tendency and positive emotion among college students. Understanding fashion impulse buying behavior can help marketers or retailers in developing strategies that create shopping opportunities. These marketing strategies may help retailers manage highly involved fashion customers and encourage their purchase intentions. The benefits include an increased market share for fashion retailers and positive perceptions of impulse buying by fashion consumers.

## **1.2. PROBLEM STATEMENT**

- 1) Does fashion involvement have a significant influence on positive emotion?
- 2) Does fashion involvement have a significant influence on hedonic consumption?
- 3) Does fashion involvement have a significant direct influence on fashion-oriented impulse buying?
- 4) Does positive emotion have a significant influence on fashion-oriented impulse buying?

- 5) Does hedonic consumption have a significant influence on positive emotion?
- 6) Does hedonic consumption have a significant influence on fashion-oriented impulse buying?

### **1.3. RESEARCH OBJECTIVE**

The objectives of this research are to determine:

- 1) Whether fashion involvement has a significant influence on positive emotion.
- 2) Whether involvement has a significant influence on hedonic consumption.
- 3) Whether fashion involvement has a significant direct influence on fashion-oriented impulse buying.
- 4) Whether positive emotion has a significant influence on fashion-oriented impulse buying.
- 5) Whether hedonic consumption has a significant influence on positive emotion.
- 6) Whether consumption has a significant influence on fashion-oriented impulse buying.

### **1.4. BENEFITS OF RESEARCH**

#### *Theoretical Benefits*

This research will provide information on the causal relationship among fashion involvement, hedonic consumption, positive emotion, and impulse buying on apparel.

Thus, it provides contribution to further research of impulse buying in the field of consumer marketing and fashion marketing and provide additional literature on both studies.

### *Practical Benefits*

This research can provide the information for retailer to further understand fashion involvement, hedonic consumption, and positive emotion as the variables that might affect impulse buying behavior. Understanding fashion impulse buying behavior offers retailers guidance in developing strategies that create shopping opportunities. These marketing strategies may help retailers manage highly involved fashion customers and encourage their purchase intentions.

## **1.5. LIMITATION OF THE STUDY**

Due to the conditions and existing limitation during this research process, there are several limitations of this research, as follow:

1. The sample was geographically limited and the age range was narrow. The Data collected in other areas might produce different results.
2. This research only took Indonesian college students that were located within Yogyakarta area which were familiar with fashion.

3. The instrument was limited to a quantitative method. The survey asked participants to answer the questions based on their interest toward fashion and their impulse buying experiences. The qualitative research methods might bring different results.

## **1.6. SYSTEMATICAL WRITING**

This thesis consists of five chapters while each chapter consists of several section, as follow:

### **CHAPTER I: INTRODUCTION**

This chapter discusses the background of the research study, the formulation of the problems, the objectives of the research study, the benefits or contributions of the research, the limitation and the systematical writing of the research.

### **CHAPTER II: LITERATURE REVIEW**

The chapter includes the theoretical foundation of the variables examined, which are fashion involvement, positive emotion, hedonic consumption tendency, and fashion-oriented impulse buying with the researchers' hypotheses, the framework of the research and several previous study related to this research study.

## CHAPTER II: RESEARCH METHOD

This chapter explains the models and method used in this research to examined the variables, population, sample, sampling method/technique, the variables of the study, the measurement of the instrument, and the testing methods used.

## CHAPTER IV: DATA ANALYSIS AND DISCUSSION

This chapter shows data analysis and discussion of the result obtained from statistical calculation using theoretical concepts and interpretation of research theories that are already existed.

## CHAPTER V: CONCLUSIONS AND RECCOMENDATIONS

This chapter explains the conclusions of the research, analysis, and calculation of the obtained data from the research. In addition, this chapter also describes the weaknesses of the research and recommendations for future research.

## **CHAPTER II**

### **LITERATURE REVIEW**

#### **2.1 IMPULSE BUYING**

##### **2.1.1 IMPULSE BUYING BEHAVIOR**

Impulse buying behavior is a sudden, compelling, hedonically complex buying behavior in which the fastness urge of an impulse decision process moves past thoughtful and deliberate consideration of other information (Bayley and Nancarrow, 1998). Several previous studies have reported that consumer might not view impulse buying as a wrong act, instead consumer feel favorable toward their impulse buying behavior (Dittmar *et al.*, 1996; Hausmann, 2000 and Rook, 1987). Researchers have treated impulse buying behavior as an individual's variables differences that is likely to influence their decision making process (Beatty and Ferrell, 1998; Rook and Fisher, 1995 and Weun *et al.*, 1997). Impulse buying is considered as a reasonable unplanned behavior when it is related to objective evaluation and emotional preferences when shopping (Ko, 1993).

##### **2.1.2 FASHION-ORIENTED IMPULSE BUYING**

According to Jones *et al.* (2003), consumer impulse buying is an important concept as well as product involvement as they are involved with a specific product. Fashion-oriented impulse buying refers to an individual's awareness or

perception of fashionable attributes, design, or style of clothing (Park *et al.*, 2006). Thus, fashion-oriented impulse buying is more likely to occur when consumers see or find new fashion products and buy it because they are motivated by the suggestion to buy new products which has new design or style (Han *et al.*, 1991). Early researches on impulse buying behavior are more concentrated on the typology of impulse buying behavior. According to Han *et al.* (1991), impulse buying is classified into four types: (1) planned impulse buying, (2) reminded impulse buying, (3) fashion-oriented impulse buying, and (4) pure impulse buying. Han *et al.* (1991) found high evidence of fashion-oriented impulse buying for college students majoring in related field of fashion (e.g. textile and clothing) compared to students in other major. Thus, their findings suggested that fashion-oriented impulse buying might be related and more likely to occur on students with majors having high fashion involvement. Subsequent research focused on impulse buying which was based on consumers' decision making process. Impulse buying behavior on apparel products was distinguished from reasonable unplanned buying that was based on emotional preference or objective evaluation rather than rational evaluation (Ko, 1993). Ko's (1993) finding implied that emotional factors might lead to fashion-oriented impulse buying behavior when shopping. According to Park *et al.*, (2006) limited studies have reported that consumers are likely to be motivated to impulse buying by high involvement and emotional preference of products. The lack of research focused on the experiential aspects of

consumption underscore the need to understand how fashion-oriented impulse buying relates to hedonic consumption tendency or the emotional factor in retail environments.

## **2.2 FASHION INVOLVEMENT**

Involvement is a helpful metric for examining and explaining consumer behavior and segmenting consumer market (Kapferer and Laurent, 1985; Martin, 1998 and Kim, 2005). Involvement is the motivational arousal or interest triggered by a particular stimulus or situation, and displayed through drive (O’Cass, 2004). To simplified, involvement is a conceptualized interaction between an individual (consumer) and object (product).

In marketing, involvement refers to the extent interest with a certain product. Specifically, in fashion marketing, involvement refers to the interest toward fashion product (e.g. apparel) (Park *et al.*, 2006). According to Fairhurst, *et al.* (1989), fashion involvement is primarily used to predict behavioral variables related to apparel products such as; product involvement, buying behavior, and consumer characteristic. O’Cass (2000, 2004) found that fashion involvement related highly to personal characteristic and fashion knowledge which influenced consumers’ confidence in making purchase decision which is positive relation between fashion involvement and apparel purchasing. Fairhurst *et al.*, 1989 and Seo *et al.*, 2001, suggested that consumers with high fashion involvement were more likely to buy

apparel. Thus, it can be assumed that consumers with high fashion involvement are more likely to induce themselves in fashion-oriented impulse buying. Haq *et al.* (2014) found that there is a mediating relationship between fashion involvement and impulse buying. Therefore, it is suggested that there is a positive relationship between fashion involvement and hedonic consumption.

*H1: Fashion involvement has a positive influence on positive emotion during shopping.*

*H2: Fashion involvement has a positive influence on fashion-oriented impulse buying during shopping.*

*H3: Fashion involvement has a positive influence on hedonic consumption tendency.*

Park, E. J., E. Y. Kim, and J. C. Forney (2006)	A Structural Model of Fashion-oriented Impulse Buying Behavior	<ul style="list-style-type: none"> <li>- Fashion Involvement</li> <li>- Hedonic Consumption</li> <li>- Positive Emotion</li> <li>- Impulse Buying</li> </ul>	1) Fashion involvement and positive emotion had positive influences on consumers' fashion-oriented impulse buying behavior with fashion involvement having the greatest influence.
---	--	--	--

### **2.3 HEDONIC CONSUMPTION**

Hirschman and Holbrook (1982) defined hedonic consumption as behavioral aspect related to multi-sensory fantasy, and emotional consumption, which is driven by benefits such as fun (using the product) and aesthetic appeal. Moreover, Sherry (1990) stated that bargaining and haggling are two shopping experiences associated with shopping enjoyment. These suggest that the experiences while shopping may be more important than the product acquisition.

Impulse buying has an important role in fulfilling hedonic desires associated with hedonic consumption (Hausman, 2000; Piron, 1991 and Rook, 1987). Haq *et al.* (2014) stated that hedonic consumption fully mediates the relationship between fashion involvement and impulse buying. These findings support a conceptual link between hedonic shopping motivation, impulse buying behavior, and also fashion involvement. Consumers are more likely to engage in impulse buying when they are motivated by hedonic desire or by non-economic reasons, such as fun, fantasy, and social or emotional gratification (Hausman, 2000 and Rook, 1987).

Since shopping experiences goals are mostly referred as an activity to satisfy hedonic needs, the products purchased during these excursions appear to be selected without prior planning and they represent an impulse buying event. Moreover, Goldsmith and Emmert (1991) stated that fashion-oriented impulse buying behavior

is motivated by new versions of fashion styles and brand image salience which drives consumers' hedonic desires toward hedonic shopping experiences.

*H4: Hedonic consumption tendency has positive influence on positive emotion during shopping.*

*H5: Hedonic consumption tendency has a positive influence on fashion-oriented impulse buying behavior during shopping.*

Haq, M. A., N. R. Khan, and A. M. Ghouri (2014)	Measuring the Mediating Impact of Hedonic Consumption on Fashion Involvement and Impulse Buying Behavior	<ul style="list-style-type: none"> <li>- Fashion Involvement</li> <li>- Hedonic Consumption</li> <li>- Impulse Buying</li> </ul>	1) Hedonic consumption fully mediates the relationship between fashion involvement and impulse buying .
---	---	--	---

## 2.4 POSITIVE EMOTION

Emotion that encompasses affect and mood is an important factor in consumer decision making. Typically, emotion is classified into two orthogonal dimensions, which are positive and negative (Watson and Tellegen, 1985). Several previous studies reported that consumers felt uplifted or energized after shopping experiences

(Bayley and Nancarrow, 1998; Dittmar *et al.*, 1996 and Rook, 1987). Emotion especially positive emotion can be generated by an individual's pre-existing mood, affective disposition, and reaction toward current environmental encounters (e.g. desired items, sales promotions).

Several previous studies stated that emotion strongly influences actions including impulse buying (Beatty and Ferrell, 1998; Hausman, 2000; Rook and Gardner, 1993 and Youn and Faber, 2000). Consumers in more positive emotional states are more likely to have reduced decision complexity and shorter decision time (Isen, 1984). Moreover, on comparison with negative emotion, consumers with positive emotion exhibited greater impulse buying because of feeling of beings unconstrained, a desire to reward themselves, and higher energy levels (Rook and Gardner, 1993).

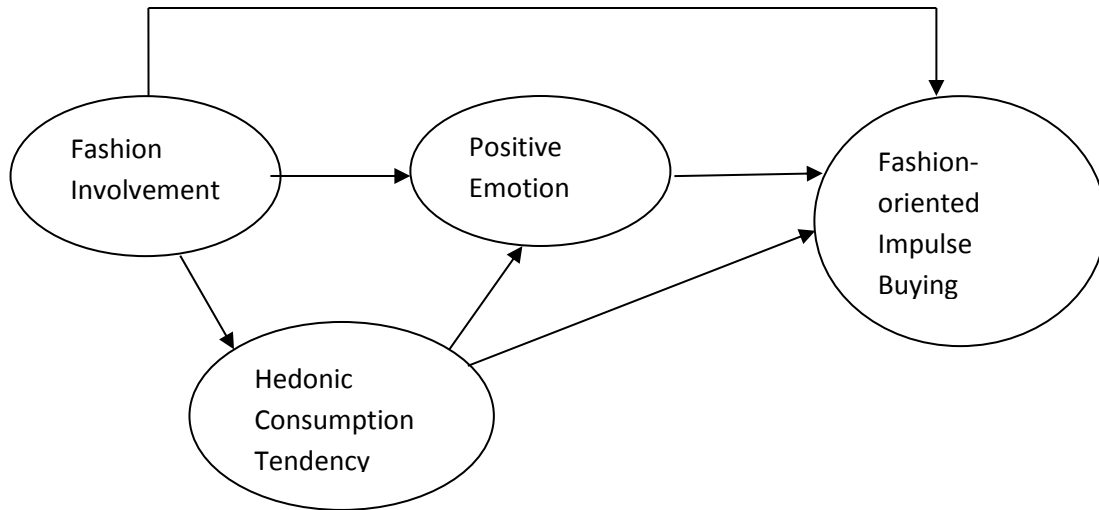

While shopping, in-store emotion can influence purchase intentions and spending as well as perceptions of quality, satisfaction, and value (Babin and Babin, 2001). Beatty and Ferrell (1998) found that consumer's positive was associated with the urge to buy impulsively. This support earlier finding that impulse buyers are more emotional compared to non-impulse buyers (Weinberg and Gottwald, 1982). Moreover, because impulse buyers exhibit greater positive feelings (e.g. pleasure, excitement, joy). They often over spend when shopping (Donovan and Rossiter, 1982). Furthermore, unplanned apparel purchases satisfy the emotional need derived from the social interaction inherent in the shopping experience (Cha, 2001). Thus,

consumer emotion can be an important determinant for predicting impulse buying in a retail store.

*H6: Positive emotion has a positive influence on fashion-oriented impulse buying behavior during shopping.*

Chang, H. J., M. Eckman, & R. N. Yan (2011)	Application of Stimulus- Organism- Response Model to The Retail Environment: The Role of Hedonic Motivation in Impulse Buying Behavior	<ul style="list-style-type: none"> <li>- Retail Environment</li> <li>- Positive Emotion</li> <li>- Impulse Buying</li> <li>- Hedonic Motivation</li> </ul>	1) Consumers' positive emotional responses influenced positively their impulse buying behavior
--	--	--	--

## 2.5 THEORETICAL FRAMEWORK

*Figure 2.1 Theoretical Framework*

The research model depicted in Figure 1 was developed to examine consumers' impulse buying behavior toward fashion products (Park *et al.*, 2006). It illustrates the causal relationships among four variables (fashion involvement, positive emotion, hedonic consumption tendency, and fashion-oriented impulse buying) in a shopping context. In this causative relationship, fashion involvement is assumed to influence positive emotion, hedonic consumption tendency, and fashion-oriented impulse buying. In addition, emotion and hedonic consumption tendency are assumed to influence fashion-oriented impulse buying behavior.

## **CHAPTER III**

### **RESEARCH METHODOLOGY**

#### **3.1 TYPE OF STUDY**

The purpose of this research is to examine the causal relationship and to test the hypothesis. This research examined the relationship and/or correlation among fashion involvement, positive emotion, and hedonic consumption tendency in influencing college students' fashion-oriented impulse buying. The results of this research were expected to give a better understanding about the relationship among variables, and provide an insight for fashion marketing based on the variables. The approach used in this research was quantitative approach, conducted by spreading questionnaire as the research instrument and Likert scale was used as the itemized rating scale to assess data from 219 respondents who were familiar with fashion.

#### **3.2 RESEARCH LOCATION**

The location of this research was Yogyakarta without specific regional characteristics. Yogyakarta was chosen for its number of students and universities. With a high population of students, the fashion trend around students has shown to be significant. Moreover, Yogyakarta area is undergoing a very significant development regarding with business retail, especially fashion retails which will be a great circumstance for this research.

### **3.3 POPULATION AND SAMPLE**

Population is the scope or magnitude characteristic of the whole object under study. The sample is the amount of certain characteristics of the part of the population that has the same characteristics of the population (“Populations and Sampling”, n.d). The population was college students who lives within Yogyakarta, Indonesia and who were familiar with fashion. The range of age followed the common age of college students from freshman to senior.

The method of purposive sampling was used to develop the sample for the research. Purposive sampling belongs to the non-probability sampling technique. The members of the sample was selected based on their knowledge, relationships, and expertise regarding a research subject (Black, 2010). In this research the samples that were selected knew about the phenomenon under investigation and involve actively in the fashion trend. The sample in this research was 219 people. The number of the samples is based on the analysis tool, which is Structural Equation Modeling (SEM). SEM required the sample size to be 5-10 times the number of observation for each estimated parameters or indicators used (Ferdinand, 2006).

### **3.4 DATA TYPES AND COLLECTION TECHNIQUES**

The data used in this research was both primary and secondary data. The primary data obtained directly using a questionnaire distributed to 400 respondents, 200 in a private university the other half in public university. However, questionnaire that passed the purposive sampling was only 219. All questions in the questionnaire were translated into *Bahasa Indonesia* to help the respondent understand the questions. The questionnaires were distributed both offline or directly (print out) and online (Google forms) to the respondents. The secondary data used in this research was obtained from previous literature review and journal relevant to the research.

### **3.5 INSTRUMENTATION**

The instrument used to obtain the primary data in this research was in survey format. Questions were adopted from previous research with the consent and help of the researcher's thesis committee. Variables investigated were mostly related with internal factors. The research, therefore, focused on the influences of both involvement, and emotion on college students' fashion-oriented impulse buying behavior.

The questionnaire consisted of five major sections measuring college students' fashion involvement, positive emotion, hedonic consumption tendency, fashion-oriented impulse buying tendency, and demographics. The first section of the survey

consisted of questions to determine the respondents' demographic profile, such as age, gender, disposable income, university, and major. Sections two through section four consisted of questions measuring the independent variables that were expected to influence college students' fashion-oriented impulse buying. These were fashion involvement, positive emotion, and hedonic consumption. Finally, the last section includes questions measuring the college students' fashion-oriented impulse buying.

A six-point Likert scale, ranging from strongly unlikely=1 to strongly likely=6 was used to measure each variable, in order to avoid neutral answer. Participants were asked to circle the number that best described their response. Demographic items were measured using multiple choices formats. All instructions and consent information were included in the questionnaire both offline and online.

### **3.6 VARIABLES DEFINITION AND MEASUREMENT**

The variables that was be analyzed in this research were fashion involvement as the independent variables and 3 dependent variables which were positive emotion, hedonic consumption and fashion-oriented impulse buying which affected by the independent variable. Then, to measure those variables, this research used Six-Points Likert Scale, where 1 indicated very unlikely and 6 showed very likely.

1) *Fashion involvement*

Involvement is a helpful metric for explaining consumer behavior and segmenting consumer markets (Kapferer and Laurent, 1985; Kim, 2005; Martin, 1998). Involvement is the motivational state of arousal or interest evoked by a particular stimulus or situation, and displayed through protiperties of drive (O’Cass, 2004). This variable is measured by these indicators (Fairhurst *et al.*, 1989):

- a) I usually have one or more outfits of the very latest style.
- b) An important part of my life and activities is dressing smartly.
- c) I am interested in shopping at boutique or fashion specialty stores rather than at department stores for my fashion needs.
- d) I usually dress for fashion, not comfort, if I must choose between two.
- e) I am interested in fashion trend every year.

2) *Positive Emotion*

Positive emotion can be elicited by an individual’s pre-existing mood, affective disposition, and reaction to current environmental encounters (e.g. desired items, sales promotions). This variable was measured by these indicators (Beatty and Ferrell, 1998, and Dawson *et al.*, 1990):

- a) I tend to feel excited when and after shopping.
- b) I tend to feel satisfied when and after shopping.
- c) I tend to feel happy when and after shopping
- d) I tend to feel uplifted when and after shopping

e) I tend to feel more self-rewarded when and after shopping

3) *Hedonic Consumption Tendency*

Hedonic consumption includes those behavioral aspects related to multi-sensory, fantasy, and emotional consumption, which are driven by benefits such as fun using the product and aesthetic appeal (Hirschman and Holbrook, 1982). Bargaining and haggling are two shopping experiences associated with shopping enjoyment (Sherry, 1990). This variable was measured by these indicators (Hausman, 2000 and Chang *et al.*, 2011):

a) I want to satisfy my sense of curiosity.

b) I want to be offered new experiences.

c) I want to feel like I am exploring new world.

d) Shopping is one of the activities to spend my leisure time.

e) Shopping is an exciting activity.

4) *Fashion Oriented Impulse Buying*

Fashion-oriented impulse buying refers to a person's awareness or perception of fashion ability attributed to an innovative design or style. That is, fashion-oriented impulse buying occurs when consumers see a new fashion product and buy it because they are motivated by the suggestion to buy new products (Han *et al.*, 1991). This variable was measured by these indicators (Han *et al.*, 1991 and Chang *et al.*, 2011):

- a) I buy clothing with a new style if I see it.
- b) I buy to try out a garment with a new feature.
- c) I like to buy new clothing that just comes out.
- d) Sometimes I buy clothes which I did not plan to.
- e) I feel excited when I see new clothes.

**Table 3.1: Empirical Support for the Questionnaire**

Questionnaire	Empirical Support (Question Number)
<p><b>Section 1: Fashion Involvement</b></p> <ol style="list-style-type: none"> <li>1. I usually have one or more outfits of the very latest style.</li> <li>2. ### **3.7 VALIDITY AND RELIABILITY TEST OF THE INSTRUMENT**

Validity test indicates the extent to which an indicator could explain the observed variables. A valid indicator is an indicator with a value corrected item of total correlation equal or more than .30. An indicator which has a value corrected item total correlation below .30 it will be considered as an invalid indicator. The reliability test was conducted to analyze the consistency of the measurement tool. The value of Cronbach Alpha need to be greater than .60 to be considered reliable (Sekaran, 2000).

Before distributing questionnaire to the samples as a data collection tool, it needed to be tested for its validity and reliability. The initial questionnaire was distributed to 38 respondents as a pilot test, to test its validity and reliability. Table 3.2 below presents the detail result of the validity and reliability test using SPSS.

**Table 3.2: Initial Questionnaire Validity and Reliability Test**

<b>Constructs/Indicator</b>	<b>Item-Total Correlation</b>	<b>Cronbach Alpha</b>	<b>Minimal Score</b>	<b>Status</b>
<b>FASHION INVOLVEMENT</b>		<b>.649</b>	<b>.6</b>	<b>Reliable</b>
I usually have one or more outfits of the very latest style.	.673		.3	Valid
An important part of my life and activities is dressing smartly.	.784		.3	Valid
I am interested in shopping at boutique or fashion specialty stores rather than at department stores for my fashion needs.	.451		.3	Valid
I usually dress for fashion, not comfort, if I must choose between two.	.818		.3	Valid
I am interested in fashion trend every year.	.750		.3	Valid
<b>POSITIVE EMOTION</b>		<b>.917</b>	<b>.6</b>	<b>Reliable</b>
I tend to feel excited when and after shopping.	.893		.3	Valid
I tend to feel satisfied when and after shopping.	.934		.3	Valid
I tend to feel happy when and after shopping.	.944		.3	Valid
I tend to feel uplifted when and after shopping.	.857		.3	Valid
I tend to feel more self-rewarded when and after shopping.	.709		.3	Valid
<b>HEDONIC CONSUMPTION TENDENCY</b>		<b>.747</b>	<b>.6</b>	<b>Reliable</b>
I want to satisfy my sense of curiosity.	.663		.3	Valid
I want to be offered new experiences.	.730		.3	Valid
I want to feel like I am exploring new worlds.	.765		.3	Valid
Shopping is one of activity to spend my leisure time.	.770		.3	Valid
Shopping is an exciting activity.	.623		.3	Valid
<b>FASHION-ORIENTED IMPULSE BUYING</b>		<b>.653</b>	<b>.6</b>	<b>Reliable</b>
I buy clothing with a new style if I see it.	.807		.3	Valid
I buy to try out a garment with a new feature.	.693		.3	Valid
I like to buy new clothing that just come out.	.682		.3	Valid
Sometimes I buy clothes, which I did not plan to.	.455		.3	Valid
I feel excited when I see new clothes.	.654		.3	Valid

### **3.8 ANALYSIS TECHNIQUE**

This research mainly used AMOS and SPSS to conduct data analysis. This research consisted of two steps of data analysis. The first step of analysis was conduct pilot test. Pilot test was conducted to test the validity and reliability of the indicators used in the questionnaire. Pilot test was conducted by spreading questionnaire for 38 respondents, and the results was analyzed by using SPSS. Once the pilot test completed, the next step is measuring the error, testing the structural model as well as research hypotheses, and analyzing the model fitness by using AMOS (Ghozali & Fuad, 2008).

Structural equation modeling (SEM) is used as the technical analysis in this research, by considering the conceptual model of this research. It has three dependent variables, two mediating variables, and one independent variable. This model cannot be analyzed using multiple regression analysis. Therefore, this research used AMOS, which is one of the programs for SEM analysis. It is an analysis technique that allows the researcher to analyze the influence of several variables against other variables simultaneously (Ghozali *et al.*, 2008).

### **3.8.1. RESPONDENTS' CHARACTERISTIC**

In this part, this research describes the demographic characteristic of the respondents. The demographic characteristics explain the number of fashion products bought every year, gender, age, expenses per month, university, and study field taken.

### **3.8.2. DESCRIPTIVE ANALYSIS**

Descriptive analysis is a set of brief descriptive coefficients that summarizes a given data set, which can either be a representation of the entire population or a sample. Descriptive analysis is used for describing the average of respondents' responds toward each item in the questioner ("Descriptive Statistics," n.d).

### **3.8.3. MODEL DEVELOPMENT BASED ON THEORY**

Structural Equation Modeling (SEM) were statistical techniques that one can use to reduce the number of observed variables into a smaller number of latent variables by examining the covariation among the observed variables. SEM has been described as a combination of exploratory factor analysis and multiple regression which is more of a confirmatory technique, but it can also be used for exploratory purposes. SEM allows researchers to test theoretical propositions regarding how constructs are theoretically linked and the directionality of significant relationships (Schreiber *et al.*, 2006).

### **3.8.3.1. PATH DIAGRAM AND STRUCTURAL EQUATION**

SEM extends the possibility of relationships among the latent variables and encompasses two components: (a) a measurement model (essentially the CFA) and (b) a structural model. In addition to the above terms (measurement and structural model), two other terms are associated with SEM: *exogenous* which is similar to independent variables and *endogenous* which is similar to dependent or outcome variables. Exogenous and endogenous variables can be observed or unobserved depend on the model being tested. Within the context of structural modeling, exogenous variables represent those constructs that exert an influence on other constructs under research and are not influenced by other factors in the quantitative model. Those constructs identified as endogenous are affected by exogenous and other endogenous variables in the model (Schreiber et al., 2006).

### **3.8.3.2. CHOOSING INPUT MATRIX AND ESTIMATION MODEL**

SEM procedures give more emphasis on the use of covariance than individual cases. In SEM, the difference between the sample covariance and covariance of the predicted model is minimized. In other way, SEM was interpreted as the difference between the predicted/fitted covariance with the observed covariance.

The covariance matrix has more advantages than other correlation matrix in giving comparison about validity between different population and different sample. The use of correlation is best suited if the researcher objectives are simply to understand the pattern of construct relationship, but do not describe the total variance of the construct (Ghozali *et al.*, 2008).

### **3.8.3.3. STRUCTURAL EQUATION MODEL (SEM) IDENTIFICATION**

SEM focus on finding unique value that can be estimated. If the model cannot be estimated, more or less there is no unique value in the model coefficient. In contrast, parameter estimation will be arbiter if a model has some estimates that may fit in the model. SEM models can be said to be good if it has a unique solution for parameter estimation (Kasanah, 2015).

In identification of the SEM, as mentioned in Haryono & Wardoyo (2012), the researcher found the identification problem. Identification problem is the incapability of the proposed model to result the estimation model. In order to see identification model, it can be done by examining the estimation result which can be concluded as:

1. *Unidentified model*, if estimated parameter value is bigger than the amount of variance and covariance among the manifest variables.
2. *Just identified*, estimated parameter value is the same as the amount of variance and covariance among the manifest variables.
3. *Over identified*, estimated parameter value is smaller than the amount of variance and covariance among the manifest variables.

#### **3.8.3.4. GOODNESS OF FIT CRITERIA**

There are six types of measurement in Goodness of Fit:

##### **A. Chi-square ( $X^2$ )**

The chi-square test statistic is used for hypothesis testing to evaluate the appropriateness of a structural equation model. If the distributional assumptions are fulfilled, the chi-square test evaluates whether the population covariance matrix is equal to the model-implied covariance matrix (Schermelleh-Engel *et al.*, 2003).

In general, high chi-square values in relation to the number of degrees of freedom indicate that the population covariance matrix and the model-implied covariance matrix differ significantly from each other. As the residuals, the elements of empirical covariance matrix minus the model implied covariance matrix should be close to zero for a good model fit. The researcher is interested in obtaining a non-

significant chi-square value with the associated degrees of freedom. If the  $p$ -value associated with the chi-square value is larger than 0.05, the null hypothesis is accepted and the model is regarded as compatible with the population covariance matrix. In this case the test states that the model fits the data, but still an uncertainty exists that other models may fit the data equally well (Schermelele-Engel *et al.*, 2003).

### **B. RMSEA (Root Mean Square Error of Approximation)**

Root Mean Square Error of Approximation (RMSEA) is a measurement of approximate fit in the population and is therefore concerned with the discrepancy due to approximation. RMSEA is estimated by the square root of the estimated discrepancy due to approximation per degree of freedom. RMSEA is regarded as relatively independent of sample size, and additionally favors parsimonious models (Schermelele-Engel *et al.*, 2003).

The RMSEA is bounded below zero. Schermelele-Engel *et al.* (2003) defined a "close fit" as a RMSEA value less than or equal to 0.05. It explained that, the value of  $\leq 0.05$  can be considered as a good fit, the value between 0.05 and 0.08 as an adequate fit, and the value between 0.08 and 0.10 as a mediocre fit. While, the value of  $> 0.10$  is not acceptable. Although there is a general agreement that the value of

RMSEA for a good model should be less than 0.05, an RMSEA of less than 0.06 is a cutoff criterion.

### **C. GFI (Goodness of Fit Index)**

The Goodness-of-Fit-Index (GFI) measures the relative amount of the variances and covariance in the empirical covariance matrix that is predicted by the model-implied covariance matrix. GFI could imply to test on how good the model fits as compared to "no model at all" (null model), or it can be said when all parameters are fixed to zero (Schermelleh-Engel *et al.*, 2003).

In some cases, a negative GFI may occur. However, the usual rule is that 0.95 is an indicator of good fit relative to the baseline model, while the value which is greater than 0.90 is usually interpreted as indicating an acceptable fit (Schermelleh-Engel *et al.*, 2003).

### **D. AGFI (Adjusted Goodness of Fit)**

The main function of Adjusted Goodness-of-Fit Index (AGFI) is to adjust bias as a result of model complexity. The AGFI adjusts the model's degrees of freedom relative to the number of observed variables and therefore rewards the less complex models with fewer parameters. The AGFI approaches the GFI. A rule for this index is that

0.90 is an indicator of good fit relative to the baseline model, while the value which is greater than 0.85 may be considered as an acceptable fit (Schermelleh-Engel *et al.*, 2003).

#### **E. TLI (Tucker Lewis Index)**

Tucker–Lewis index (TLI) is also called the *non-normed fit index* (NNFI) while adjustment to the TLI is called the *relative fit index* (RFI). According to Haryono & Wardoyo (2012), TLI was originally used as a tool to evaluate the factor analysis which is later developed to SEM. This measurement combines parsimony size into comparison index between the proposed model and null model and the TLI value that ranges from 0 to 1.0. TLI recommended value is equal to or greater than 0.09.

#### **F. CFI (Comparative Fit Index)**

As mentioned by Schermelleh-Engel *et al.* (2003), the Comparative Fit Index (CFI), an adjusted version of the Relative Non-Centrality Index (RNI) which is developed by McDonald and Marsh (1990), avoids the underestimation of fit. This is often noted in small samples of Bentler and Bonett's (1980) normed fit index (NFI).

The CFI ranges from zero to one with higher value that indicates better fit. A rule for this index is that 0.97 is an indicator of good fit relative to the independence model, while the value which is greater than 0.95 can be interpreted as an acceptable fit. The value of 0.97 seemed to be more reasonable as an indication of a good model fit than the often stated cut off value of 0.95. Compared to the NNFI, the CFI is one of the fit indices which is less affected by sample size (Schermelleh-Engel *et al.*, 2003)

**Table 3.3 Goodness of Fit Index**

<b>Goodness of Fit Index</b>	<b>Cut off Value</b>
Degree of Freedom (DF)	Positive (+)
$X^2$ (Chi-Square)	Small value
<b>Goodness of Fit Index</b>	<b>Cut off Value</b>
Significance Probability	$\geq 0.05$
CMIN/DF	$\leq 2.00$
GFI (Goodness of Fit Index)	$\geq 0.90$
RMSEA (Root Mean Square Error of Approximation)	$\leq 0.08$
AGFI (Adjusted Goodness of Fit)	$\geq 0.90$
TLI (Tucker Lewis Index)	$\geq 0.90$
CFI (Comparative Fit Index)	$\geq 0.90$

## **CHAPTER IV**

### **DATA ANALYSIS AND DISCUSSION**

This chapter explains the data analysis of “College Students’ Fashion Oriented Impulse Buying in Relation to Fashion Involvement, Positive Emotion, and Hedonic Consumption”. The result of this analysis was presented through descriptive analysis of respondents’ characteristics, descriptive analysis of respondents’ responses, and SEM analysis. Structural Equation Modeling (SEM) was used as the data analysis tool in this research. Besides that, this research used AMOS as the SEM program.

The analysis was conducted in accordance with the stages in the SEM analysis as described in the previous chapter. In this research, SEM was used to evaluate the proposed model. After obtaining all the results from data processing, this research obtained proof of the hypotheses that had been developed previously. This research also found additional findings as a result of research model modification, which were then summarized into few conclusions.

As had already been explained in the previous chapter, 220 questionnaires had been spread out to 220 respondents to collect the data. The questionnaire details can be seen in appendix. The population in this research was student who studied and lived in Yogyakarta. In this research, the focus was college student. Thus, the range of age was set around the age of college students. In addition, the population in this

research was also college students who were interested in fashion. The method of sample selection in this research was non-probability purposive sampling with convenient technique.

#### **4.1. CHARACTERISTIC OF RESPONDENTS**

This section explains the descriptive data obtained from respondents. Descriptive data were presented research, in order to see the profile of research data and the relationships that exist among the variables used in the research.

##### **4.1.1. RESPONDENTS CLASSIFICATION BASED ON NUMBER OF FASHION PRODUCT BOUGHT EVERY YEAR**

The percentage of respondents by number of fashion product bought every year can be seen in table 4.1 below:

***Table 4.1 Respondents Classification Based on Number of Fashion Product Bought Every Year***

	Frequency	Percent	Valid Percent	Cumulative Percent
< 5	49	22.4	22.4	22.4
> 10	101	46.1	46.1	68.5
5 - 10	69	31.5	31.5	100.0
Total	219	100.0	100.0	

Source: primary data processed, 2017

Based on Table 4.1, it can be concluded that the respondents in this research mostly bought more than 10 fashion products every year. There were 101

respondents or 58.9% of the total respondents who bought more than 10 fashion products every year and 69 or 31.5% respondents who bought between 5 – 10 fashion product every year. In addition, there were 49 or 46.1% respondents who bought less than 5 fashion products every year. It showed that the majority of the respondents who were interested and had prior impulse buying on fashion were students who bought more than 10 fashion products every year.

#### **4.1.2. RESPONDENTS CLASSIFICATION BASED ON GENDER**

The percentage of respondents by gender can be seen in table 4.2 below:

*Table 4.2 Respondents Classification Based on Gender*

	Frequency	Percent	Valid Percent	Cumulative Percent
Male	90	41.1	41.1	41.1
Female	129	58.9	58.9	100.0
Total	219	100.0	100.0	

Source: primary data processed, 2017

Based on Table 4.2, it can be concluded that the respondents in this research were mostly women. There were 129 female respondents or 58.9% of the total respondents. In addition, there were 90 male respondents or 41.1% of the total respondents. It showed that the majority of the respondents who were interested and had prior impulse buying experiences on fashion products were women.

#### 4.1.3. RESPONDENTS CLASSIFICATION BASED ON AGE

Based on age, the respondents in this research were classified as follows:

*Table 4.3 Respondents Classification Based on Age*

	Frequency	Percent	Valid Percent	Cumulative Percent
< 20	6	2.7	2.7	2.7
> 22	91	41.6	41.6	44.3
20 - 22	122	55.7	55.7	100.0
Total	219	100.0	100.0	

Source: primary data processed, 2017

Based on Table 4.3, it can be concluded that the respondents in this research were mostly between 20-22 years old, with the total number 122 respondents or 55.7% of the total respondents. Meanwhile, the smallest percentage was for respondents aged <20 years old, which were 2.7% of the total respondents or 6 respondents.

#### 4.1.4. RESPONDENTS CLASSIFICATION BASED ON EXPENSES PER MONTH

Based on expenses per month, the respondents in this research were classified as follow:

**Table 4.4 Respondents Classification Based on Expenses per month**

	Frequency	Percent	Valid Percent	Cumulative Percent
< Rp.1,000,000	70	32.0	32.0	32.0
> Rp. 3,000,000	60	27.4	27.4	59.4
Rp. 1,000,000 - Rp. 1,499,999	21	9.6	9.6	68.9
Rp. 1,500,000 - Rp. 1,999,999	34	15.5	15.5	84.5
Rp. 2,000,000 - Rp. 2,499,999	19	8.7	8.7	93.2
Rp. 2,500,000 - Rp. 3,000,000	15	6.8	6.8	100.0
Total	219	100.0	100.0	

Source: primary data processed, 2017

Based on Table 4.4, it can be concluded that the respondents in this research mostly had expenses per month below Rp. 1,000,000 of 70 respondents or 32%, 60 or 27.4% respondents had expenses per month above Rp. 3,000,000, 34 or 15.5% respondents had expenses per month between Rp. 1,500,000 – Rp. 1,999,999, 21 or 9.6% respondents had expenses per month Rp. 1,000,000 – Rp. 1,499,999, 19 or 8.7% respondents had expenses per month between Rp. 2,000,000 – Rp. 2,499,999, and, 15 or 6.8% respondents had expenses per month between Rp. 2,500,000 – Rp.

3,000,000. This result showed that people who were interested and had prior impulse buying experiences on fashion product were mostly people who were had expenses per month under Rp. 1,000,000.

#### 4.1.5. RESPONDENTS CLASSIFICATION BASED ON UNIVERSITY

The percentage of respondents by university can be seen in table 4.2 below:

*Table 4.5 Respondents Classification Based on University*

	Frequency	Percent	Valid Percent	Cumulative Percent
Public University	69	31.5	31.5	31.5
Private University	150	68.5	68.5	100.0
Total	219	100.0	100.0	

Source: primary data processed, 2017

Based on Table 4.5, it can be concluded that the respondents in this research were mostly private university students. There were 150 respondents from private universities or 68.5% of the total respondents. In addition, there were 69 respondents from public universities or 31.5% of the total respondents. It showed that the majority of the respondents who were interested and had prior impulse buying experiences on fashion products were students from private university.

#### 4.1.6. RESPONDENTS CLASSIFICATION BASED ON FIELD TAKEN

The percentage of respondents by field taken can be seen in table 4.2 below:

*Table 4.6 Respondents Classification Based on Field Taken*

	Frequency	Percent	Valid Percent	Cumulative Percent
Non-Social Science	133	60.7	60.7	60.7
Social-Science	86	39.3	39.3	100.0
Total	219	100.0	100.0	

Source: primary data processed, 2017

Based on Table 4.6, it can be concluded that the respondents in this research were mostly non-social science students. There were 133 respondents from non-social science or 60.7% of the total respondents. In addition, there were 86 respondents from social science or 39.3% of the total respondents. It showed that the majority of the respondents who were interested and had prior impulse buying experiences on fashion products were non-social science students.

## **4.2. MEASUREMENT ANALYSIS**

In the application of AMOS, the retest of validity and reliability of the data was required. In this test, 219 responses were used as the sample. This test was used to determine whether the data were reliable and valid or not. In this test, the software of AMOS version 22.0 was used. The evaluation was assessed using Confirmatory Factor Analysis or CFA. The objective was to understand how good variables could be used to measure the construct. If the value of loading factor from each construct was more than 0.5 ( $\lambda > 0.5$ ), it was considered as valid. Moreover, if the value of construct reliability from each construct was more than 0.7, it was considered as reliable. The formula is as follows:

**Table 4.7 Validity and Reliability Test**

<b>Variable</b>	<b>Indicator</b>	<b>Loading Factor (<math>\lambda</math>)</b>	<b>Standard Error (<math>\epsilon</math>)</b>	$\Sigma (\lambda)$	$\Sigma (\epsilon)$	<b>Construct Reliability</b>	<b>Label</b>
Fashion Involvement				3.045	1.318	0.87	Reliable
	FI1	0.54	0.26				Valid
	FI2	0.62	0.25				Valid
	FI3	0.58	0.32				Valid
	FI4	0.72	0.18				Valid
	FI5	0.56	0.29				Valid
Positive Emotion				3.581	1.184	0.91	Reliable
	PE1	0.74	0.20				
	PE2	0.65	0.23				Valid
	PE3	0.68	0.32				Valid
	PE4	0.76	0.19				Valid
	PE5	0.73	0.23				Valid
Hedonic Consumption				2.975	1.719	0.83	Reliable
	HC1	0.52	0.35				Valid
	HC2	0.50	0.45				Valid
	HC3	0.60	0.32				Valid
	HC4	0.69	0.28				Valid
	HC5	0.65	0.30				
Fashion-Oriented Impulse Buying				3.276	1.417	0.88	Reliable
	IB1	0.60	0.29				Valid
	IB2	0.67	0.28				Valid
	IB3	0.74	0.24				Valid
	IB4	0.73	0.21				Valid
	IB5	0.51	0.37				

Source: primary data processed, 2017

In Table 4.7, the data indicated that all of the items on every variable were valid because the loading factors were more than 0.5 ( $\lambda > 0.5$ ). The data showed in Table 4.5

also indicated that all variables on the questionnaire for hypothesis testing model 1 were reliable because the construct reliability was more than 0.7.

### **4.3. DESCRIPTIVE ANALYSIS**

The value-average score was assisted to determine respondents' assessment criteria. The interval score could be found by calculation the following:

Lowest perception score = 1

Highest perception score = 6

Interval = Interval =  $(6 - 1) / 6 = 1$

With the detail interval as follows:

1.00 – 2.00 =	Very Bad
2.01 – 3.00 =	Bad
3.01 – 4.00 =	Fair (Neutral)
4.01 – 5.00 =	Good
5.01 – 6.00 =	Very Good

### 4.3.1. DESCRIPTIVE ANALYSIS VARIABLE OF FASHION INVOLVEMENT

From the results of respondents that had been collected, it can be explained that the variable distribution of respondents rating on fashion involvement is shown in Table 4.8 below:

*Table 4.8 Descriptive Analysis of Fashion Involvement*

No	Indicator	Average	Criteria
1	I usually have one or more outfits of the very latest style.	5.12	Very Good
2	An important part of my life and activities is dressing smartly.	4.94	Good
3	I am interested in shopping at boutique or fashion specialty stores rather than at department stores for my fashion needs.	4.84	Good
4	I usually dress for fashion, not comfort, if I must choose between two.	4.73	Good
5	I am interested in fashion trend every year.	4.77	Good
Average		4.88	Good

Source: primary data processed, 2017

Based on the results of descriptive analysis shown in Table 4.8, the average assessment of respondents' fashion involvement was 4.88 (Good). The highest

rating occurred on “I usually have one or more outfits of the very latest style” which had the value of 5.12 (Very Good). While the lowest rating occurred on “I usually dress for fashion, not comfort, if I must choose between two” of 4.73 (Good). This means that the respondents had given judgment that “I usually have one or more outfits of the very latest style” was the most important factors in assessing the fashion involvement variables.

#### **4.3.2 DESCRIPTIVE ANALYSIS VARIABLE OF POSITIVE EMOTION**

From the results of respondents that had been collected, it can be explained that the variable distribution of respondents rating on positive emotion is shown in Table 4.9 below:

**Table 4.9 Descriptive Analysis of Positive Emotion**

No	Indicator	Average	Criteria
1	I tend to feel excited when and after shopping.	4.94	Good
2	I tend to feel satisfied when and after shopping.	4.91	Good
3	I tend to feel happy when and after shopping	4.94	Good
4	I tend to feel uplifted when and after shopping	4.97	Good
5	I tend to feel more self-rewarded when and after shopping	4.93	Good
Average		4.93	Good

Source: primary data processed, 2017

Based on the results of descriptive analysis shown in Table 4.7, the average assessment of respondents' positive emotion was 4.93 (Good). The highest rating occurred on “I tend to feel uplifted when and after shopping” of 4.97 (Good). While the lowest ratings occurred on “I tend to feel satisfied when and after shopping.” of 4.91 (Good). This means that the respondents had given judgment that “I tend to feel uplifted when and after shopping” is the most important factor in assessing the positive emotion variables.

### 4.3.3 DESCRIPTIVE ANALYSIS VARIABLE OF HEDONIC CONSUMPTION

From the results of respondents that have been collected, it can be explained that on the variable distribution of respondents rating on hedonic consumption is shown in Table 4.10 below:

*Table 4.10 Descriptive Analysis of Hedonic Consumption*

No	Indicator	Average	Criteria
1	I want to satisfy my sense of curiosity.	4.76	Good
2	I want to be offered new experiences.	4.67	Good
3	I want to feel like I am exploring new worlds.	4.76	Good
4	Shopping is one of activity to spend my leisure time.	4.72	Good
5	Shopping is an exciting activity.	4.86	Good
Average		4.75	Good

Source: primary data processed, 2017

Based on the results of descriptive analysis shown in Table 4.8, the average assessment of respondents' hedonic consumption was 4.75 (Good). The highest rating occurred on “Shopping is an exciting activity.” which had the value of 4.86 (Good). While the lowest rating occurred on “I want to be offered new

experiences.” of 4.67 (Good). This means that the respondents had given judgment that “Shopping is an exciting activity.” was the most important factors in assessing the fashion involvement variables.

#### 4.3.4 DESCRIPTIVE ANALYSIS VARIABLE OF FASHION-ORIENTED IMPULSE BUYING

From the results of respondents that had been collected, it can be explained that on the variable distribution of respondents rating on fashion-oriented impulse buying is shown in Table 4.11 below:

*Table 4.11 Descriptive Analysis of Fashion-Oriented Impulse Buying*

No	Indicator	Average	Criteria
1	I buy clothing with a new style if I see it.	4.73	Good
2	I buy to try out a garment with a new feature.	4.85	Good
3	I like to buy new clothing that just came out.	4.90	Good
4	Sometimes I buy clothes, which I did not plan to.	4.94	Good
5	I feel excited when I see new clothes.	4.92	Good
Average		4.86	Good

Source: primary data processed, 2017

Based on the results of descriptive analysis shown in Table 4.9, the average assessment of respondents' fashion-oriented impulse buying was 4.86 (Good). The highest rating occurred on “Sometimes I buy clothes, which I didn’t plan to.” which had the value of 4.94 (Good). While the lowest rating occurred on “I buy clothing with a new style if I see it.” of 4.73 (Good). This means that the respondents had given judgment that “Sometimes I buy clothes, which I didn’t plan to.” was the most important factors in assessing the fashion involvement variables.

#### **4.4. GOODNESS OF FIT**

On the Structural Equation Modelling (SEM), Goodness of Fit measurement was required to determine whether the constructed model was already good or not. Therefore, Goodness of Fit Index was used to measure the goodness of the proposed model. To determine the criteria, the index used Degree of Freedom,  $X^2$  (Chi-Square), Probability, RMSEA, GFI, AGFI, CMIN/DF, TLI, and CFI.

**Table 4.12 Goodness of Fit Analysis**

<b>Goodness of Fit Index</b>	<b>Cut off Value</b>	<b>Result</b>	<b>Model Valuation</b>
Degree of Freedom (DF)	Positive	148	Good Fit
X <sup>2</sup> (Chi-Square)	Small value	172.983	Good Fit
Probability	≥ .05	.078	Good Fit
RMSEA (Root Mean Square Error of Approximation)	≤ .08	.028	Good Fit
GFI (Goodness of Fit Index)	≥ .90	0.929	Good Fit
AGFI (Adjusted Goodness of Fit)	≥ .90	.899	Nearly Good Fit
CMIN/DF	≤ 2.00	1.169	Good Fit
TLI (Tucker Lewis Index)	≥ .90	.976	Good Fit
CFI (Comparative Fit Index)	≥ .90	.982	Good Fit

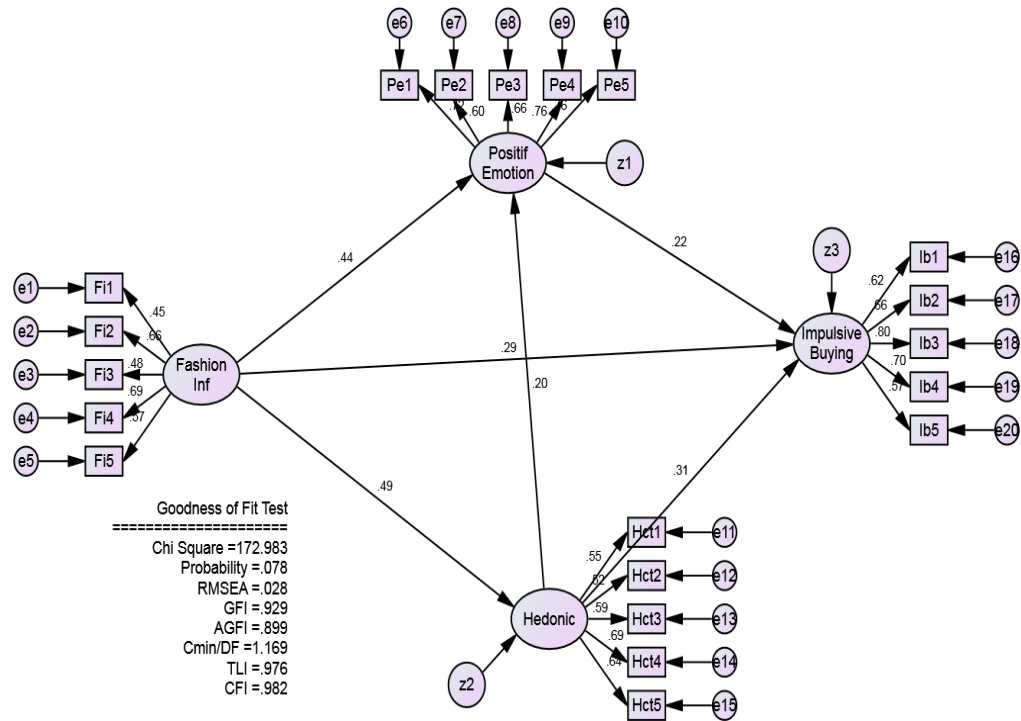

Source: primary data processed, 2017

Table 4.12 shows the result of the data analysis of Goodness of Fit measurement. The model was considered to have fulfilled the minimum criteria of the Goodness of Fit Index. One index was nearly good fit, which was AGFI (Adjusted Goodness of Fit). The result of the analysis was; Degree of Freedom with the score of 148 score, X<sup>2</sup> (Chi-Square) with the score of 172.983, Probability with the score of .078, RMSEA with the score of .028, GFI with the score of .929, AGFI with the score of .899, CMIN/DF with the score of 1.169, TLI with the score of .976, and CFI with the score of .982.

#### **4.5. HYPOTHESES TESTING**

Based on the previous discussion, there were six hypotheses in this framework. In order to investigate whether the hypotheses were supported or unsupported, the probability result of standardized regression weight estimate was analyzed. If the value of probability is less than 0.05 ( $p < 0.05$ ), the hypothesis is supported. The testing result of the research model could be seen in the model below:

**Figure 4.1 Hypothesis Testing Model**

Source: primary data, 2017

According to the analysis of AMOS version 22.0, the following was the hypothesis testing that indicated the causal relationship among the variables:

**Table 4.13 Hypothesis Testing**

Hypothesis	Variable Relationship	Estimate	p-Value	Status
H1	Positive_Emotion <--- Fashion_Involvement	.439	***	Supported
H2	Impulse_Buying <--- Fashion_Involvement	.285	.005	Supported
H3	Hedonic <--- Fashion_Involvement	.487	***	Supported
H4	Positive_Emotion <--- Hedonic	.203	.039	Supported
H5	Impulse_Buying <--- Hedonic	.307	***	Supported
H6	Impulse_Buying <--- Positive_Emotion	.222	.016	Supported

Source: primary data processed, 2017

In the first hypothesis, fashion involvement has a significant and positive influence on positive emotion. In Table 4.14, it could be seen that p-value of fashion involvement on positive emotion while shopping was .000 ( $p < .05$ ) and the path estimate was .439 (H1 was supported) which means that the hypothesis was accepted.

In the second hypothesis, fashion involvement has a positive influence on fashion-oriented impulse buying. In table 4.14, it could be seen that the p-value of fashion involvement on fashion-oriented impulse buying was .005 ( $p < .05$ ) and the path estimate was .285 (H2 was supported), which means that the hypothesis was accepted. However, the value of the p-value shows that the direct influence of fashion involvement on fashion-oriented impulse buying is not significant.

In the third hypothesis, fashion involvement has a positive influence on hedonic consumption. In table 4.14, it could be seen that the p-value of fashion involvement

on hedonic consumption was .000 ( $p < .05$ ) and the path estimate was .487 (H3 was supported), which means that the hypothesis was accepted.

In the fourth hypothesis, hedonic consumption has a positive influence on positive emotion while shopping. In Table 4.14, it could be seen that p-value of hedonic consumption on positive emotion was .039 ( $p < .05$ ) and the path estimate was .203 (H4 was supported), which means that the hypothesis was accepted. However, the influence of hedonic consumption on positive emotion while shopping was not significant.

In the fifth hypothesis, hedonic consumption has a positive influence on fashion-oriented impulse buying. In Table 4.14, it could be seen that p-value of hedonic consumption on fashion-oriented impulse buying was .000 ( $p < .05$ ) and the path estimate was .307 (H5 was supported), which means that the hypothesis was accepted.

In the sixth hypothesis, positive emotion has a positive influence on fashion-oriented impulse buying. In table 4.14, it could be seen that the p-value of positive emotion on fashion-oriented impulse buying was .016 ( $p < .05$ ) and the path estimate was .222 (H6 was supported), which means that the hypothesis was accepted. However, the influence was not significant.

## 4.6. RESULT AND DISCUSSION

The result of hypotheses testing can be seen in table 4.14. For further explanation, the result is explained below:

*H1: Fashion involvement has a positive influence on positive emotion during shopping*

Table 4.14 showed the analysis result of fashion involvement which had positive influence on positive emotion. Based on the analysis result, statistically fashion involvement significantly affects positive emotion, which was acceptable. It was shown by the p-values, which were obtained from structural Equation Modeling (SEM) calculation of .00, which was lower than the p-value of .05 with path estimate equal to .439. Thus, the hypothesis H1, which stated that fashion involvement has a positive influence on positive emotion during shopping, was acceptable.

This result was in line with the previous research by O’Cass (2000, 2004), which found that fashion involvement related highly to personal characteristic and fashion knowledge, which influenced consumers’ confidence in making purchase decision. Therefore, the higher of confidence the more positive the emotion will be. Previous research suggested that there is a mediating relationship between fashion involvement and impulse buying (Haq *et al.*, 2014). Fashion involvement and positive emotion had positive influence on consumers’ fashion-oriented impulse buying behavior with fashion involvement having the greatest influence. Fashion involvement can lead

toward a positive emotion during shopping which can trigger an impulsive buying behavior (Park *et al.*, 2006). Moreover, the more positive the items within fashion involvement such as “I’m interested in fashion trend every year” the more positive the influence on positive emotion will be.

*H2: Fashion involvement has a positive influence on fashion-oriented impulse buying during shopping.*

Table 4.14 showed the analysis result of fashion involvement which had positive influence on fashion-oriented impulse buying. Based on the analysis result, statistically fashion involvement showed its affecting fashion-oriented impulse buying, which was acceptable. It was shown by the p-values, which were obtained from structural Equation Modeling (SEM) calculation of .005, which was lower than the p-value of .05 with path estimate equal to .285. Thus, the hypothesis H2, which stated that fashion involvement has a positive influence on fashion-oriented impulse buying during shopping, was acceptable.

This result was in line with Park *et al.* (2006), which found that both fashion involvement and positive emotion had a positive influence on fashion-oriented impulse buying. Rather than maximizing product functionality, consumers tend to look for a more personal, experimental and symbolic gain in high involvement situations, (Solomon *et al.*, 1985). Thus, consumers were more likely to have the urge on fashion-oriented impulse buying when they have a higher fashion involvement

(Nooreini, 2014). Moreover, the more positive the items within fashion involvement such as “I usually have one or more outfits of the very latest style.” the more positive the influence on fashion-oriented impulse buying will be.

*H3: Fashion involvement has a positive influence on hedonic consumption tendency.*

Table 4.14 showed the analysis result of fashion involvement which had positive influence on hedonic consumption. Based on the analysis result, statistically fashion involvement showed its affecting hedonic consumption, which was acceptable. It was shown by the p-values, which were obtained from structural Equation Modeling (SEM) calculation of .00, which was lower than the p-value of .05 with path estimate equal to .487. Thus, the hypothesis H3, which stated that fashion involvement has a positive influence on hedonic consumption tendency, was acceptable.

When consumers are motivated by hedonic desire or by non-economic reasons, such as fun, fantasy, and social or emotional gratification they are more likely to have the urge to buy impulse (Hausman, 2000 and Rook, 1987). Consumers who had high involvement with the latest fashion, shopping for their fashion needs, or dressing for fashion are more likely exhibited a hedonic tendency (e.g. sense of curiosity, new experiences, exploring new worlds) during their shopping trip (Park *et al.*, 2008). This finding implied that clothing as an experiential sensory product plays an important role in fulfilling hedonic needs (e.g. novelty, diversion, stimulation) for

shopping (Hausman, 2000). Moreover, the more positive the items within fashion involvement such as “I am interested in shopping at boutique or fashion specialty stores rather than at department stores for my fashion needs” the more positive the influence on hedonic consumption will be.

*H4: Hedonic consumption tendency has positive influence on positive emotion during shopping.*

Table 4.14 showed the analysis result of hedonic consumption which had positive influence on positive emotion. Based on the analysis result, statistically hedonic consumption showed its affecting positive emotion, which was acceptable. It was shown by the p-values, which were obtained from structural Equation Modeling (SEM) calculation of .039, which was lower than the p-value of .05 with path estimate equal to .203. Thus, the hypothesis H4, which stated that hedonic consumption tendency has positive influence on positive emotion during shopping, was acceptable.

Consumers felt more excited and satisfied during their shopping trips when they expressed curiosity, the need for new experience, and feeling like they were exploring new worlds (Park *et al.*, 2006). This finding supported the involvement of hedonic or experiential shopping motivations in satisfying emotional or expressive needs, such as fun, relaxation, and gratification (Bloch *et al.*, 1991 and Roy, 1994). Moreover, this finding was consistent with previous research that found consumers’ positive feelings

(e.g. fun, psychological lift) were associated with hedonic shopping experiences and the novelty aspects of hedonic shopping (Hausman, 2000). Moreover, the more positive the items within hedonic consumption such as “Shopping is one of activity to spend my leisure time” or “Shopping is an exciting activity” the more positive the influence on positive emotion will be.

*H5: Hedonic consumption tendency has a positive influence on fashion-oriented impulse buying behavior during shopping.*

Table 4.14 showed the analysis result of hedonic consumption which had positive influence on fashion-oriented impulse buying. Based on the analysis result, statistically hedonic consumption showed its affecting fashion-oriented impulse buying, which was acceptable. It was shown by the p-values, which were obtained from structural Equation Modeling (SEM) calculation of .00, which was lower than the p-value of .05 with path estimate equal to .307. Thus, the hypothesis H5, which stated that hedonic consumption tendency has a positive influence on fashion-oriented impulse buying behavior during shopping, was acceptable.

This result did not support a notion that hedonic consumption may only be a mediating variable in order to influence impulse buying (Park *et al.*, 2006). This result did support a notion that impulse buying behavior is a form of hedonically-related consumption (Bayley and Nancarrow, 1998). It showed that impulse buying behavior as a sudden, compelling, hedonically complex buying behavior in which the

fastness urge of an impulse decision process moves past thoughtful and deliberate consideration of other information (Bayley and Nancarrow, 1998) that led toward the impulsive decision to purchase a product. Moreover, fashion-oriented impulse buying is much likely motivated by consumers' perception of a new design or style (Han et al., 1991) through their fashion involvement. Furthermore, hedonic consumption tendency is more likely to increase consumers' shopping motivations to fulfill their hedonic desires (Hausman, 2000; Piron, 1991), such as an in-store emotional experience (Yoo *et al.*, 1998) that eventually leads to impulse buying behavior. This supported the importance of consumers' emotional response in encouraging apparel impulse buying. Moreover, the more positive the items within hedonic consumption such as "I want to satisfy my sense of curiosity" or "I want to be offered new experiences" the more positive the influence on fashion-oriented impulse buying will be.

*H6: Positive emotion has a positive influence on fashion-oriented impulse buying behavior during shopping.*

Table 4.14 showed the analysis result of positive emotion which had positive influence on fashion-oriented impulse buying. Based on the analysis result, statistically positive emotion showed its affecting fashion-oriented impulse buying, which was acceptable. It was shown by the p-values, which were obtained from structural Equation Modeling (SEM) calculation of .016, which was lower than the p-

value of .05 with path estimate equal to .222. Thus, the hypothesis H6, which stated that positive emotion has a positive influence on fashion-oriented impulse buying behavior during shopping, was acceptable.

This result was in line with Isen (1984), which found that positive emotional state is more likely to have a shorter decision time, in which it will more likely to act impulsively. Thus, the more positive the emotional state of the consumers in, the more likely they have the urge to buy impulsively (Beatty and Ferrell, 1998). In this case, positive emotion showed that it had an influence as a mediating variable that led fashion involvement toward impulse buying (Park *et al.*, 2008). Several previous studies also showed a similar result (Nooreini, 2014; Chang *et al.*, 2011; Donovan and Rossiter, 1982). Moreover, the more positive the items within positive emotion such as “I tend to feel excited when and after shopping” or “I tend to feel happy when and after shopping” the more positive the influence on fashion-oriented impulse buying will be.

## **CHAPTER V**

### **CONCLUSIONS AND RECOMMENDATIONS**

#### **5.1 CONCLUSIONS**

These conclusions and suggestions are the result of a research entitled "College students' fashion-oriented impulse buying in relation to fashion involvement, positive emotion, and hedonic consumption". This research examined whether Fashion involvement has a positive influence on positive emotion, hedonic consumption and fashion-oriented impulse buying on college students. Then, this research also examined whether positive emotion and hedonic consumption have a positive influence on fashion-oriented as mediating variables between fashion involvement and fashion-oriented impulse buying. Based on the data analysis results, from the six hypotheses that proposed, all hypotheses were supported.

Fashion involvement positively affect positive emotion, hedonic consumption, and fashion-oriented impulse buying. Thus, it can be interpreted that the attributes contained within fashion involvement have an influence on college students' positive emotion, hedonic consumption and even directly affect college students' fashion-oriented impulse buying.

The result of this research also showed that fashion involvement had a positive influence on fashion-oriented impulse buying, both directly and indirectly through

positive emotion and hedonic consumption as mediating variables. Positive emotion and hedonic consumption tendency also had a positive influence on fashion-oriented impulse buying. According to the results of this research, fashion marketers need to pay attention on their after sales service and their customers in order to develop a sense of involvement between the company or brand and the customers themselves. Moreover, fashion marketer can emphasize the ambient of their company or brand whether the brand image, the store layout, or the product itself to create a fun, interesting, and positive influence on the customers' emotional state.

## **5.2. RESEARCH LIMITATIONS**

The limitations of the research are as follow:

1. The results were based on a selected sample which only consisted of college students, by providing other sample from different background might produce different result.
2. There might be other variables that influence positive emotion, hedonic consumption and fashion-oriented impulse buying which were not included in this research.
3. Researcher did not limit which brand of fashion product that the sample usually buy on impulse.

### **5.3. SUGGESTIONS**

For empirical study, researcher suggests the future study to examine the other variables that might affect positive emotion, hedonic consumption, and fashion-oriented impulse buying beside or in addition to fashion involvement. More varieties on population and sample might provide a better result or insight. Moreover, as this research was conducted in Indonesia, different location may also provide a different result. A Comparative study to further understand fashion-oriented impulse buying will also be a great additional insight for empirical studies.

For marketers, firstly, this research will contribute in giving the understanding about the decision making to create an environment in which the customers' will be triggered to have impulse buying, especially for customers that following the fashion trends. The marketers can start by creating the attributes that will affect consumers' sense of involvement and emotion, such as product innovation, product line that create a new trend, trend setter products, entertainment and information disclosure. Thus, the users will be more attracted to the company or brands. Secondly, it is important for marketers to consider the strong role of fashion involvement that is currently affecting consumers especially customers that follow the fashion trend.

## APPENDICES

## APPENDIX A

### QUESTIONNAIRE

#### Identitas Responden

Pertanyaan berikut berkenaan dengan jati diri Saudara. Jawablah pertanyaan tersebut dengan memberi tanda **silang (X)** pada nomer jawaban yang dianggap paling sesuai.

- **Identitas / karakteristik responden :**

1	< 20 tahun	
2	20 - 22 tahun	
3	> 22 tahun	

**Saya suka mengikuti perkembangan fashion/mode terkini**

1	Ya	
2	Tidak	

**Berapa jumlah produk fashion (baju, celana, jaket, sepatu, & aksesoris) yang anda beli di setiap tahun?**

1	< 5 buah	
2	5 – 10 buah	
3	> 10 buah	

**Apa jenis kelamin Saudara ?**

1	Pria	
2	Wanita	

**Berapakah usia Saudara pada ulang tahun terakhir ?**

**Berapakah penghasilan/sangu per-bulan saudara?**

1	Dibawah Rp. 1,000,000	
2	Rp. 1,000,000 - Rp. 1,499,000	
3	Rp. 1,500,000 - Rp. 1,999,000	
4	Rp. 2,000,000 - Rp. 2,499,000	
5	Rp. 2,500,000 - Rp. 2,999,000	
6	Diatas Rp. 3,000,000	

**Dimana tempat anda menempuh ilmu?**

1	Universitas negeri	
2	Universitas swasta	

**Apa prodi yang sedang anda tempuh?**

1	Ilmu sosial	
2	Ilmu non-sosial	

## Evaluasi Fashion Involvement

***Petunjuk:*** Berilah penilaian Saudara berkenaan dengan ketertarikan saudara terhadap fashion dengan **MENYILANG** atau **MELINGKARI** angka yang sesuai:

<b>1. = Sangat Tidak Setuju (STS)</b>	<b>3. = Agak Tidak Setuju (ATS)</b>	<b>5.= Setuju</b>
<b>2. = Tidak Setuju (TS)</b>	<b>4. = Agak Setuju (AS)</b>	<b>6.= Setuju Sekali</b>

Pengukuran Fashion Involvement	Sama Sekali Tidak Setuju			Sangat Setuju		
	STS	TS	ATS	AS	S	SS
1. Setidaknya saya memiliki lebih dari 1 jenis produk fashion yang paling baru di setiap tahunnya.	1	2	3	4	5	6
2. Bagi saya berproduk fashion yang menarik merupakan hal yang penting.	1	2	3	4	5	6
3. Saya lebih suka berbelanja produk fashion di toko khusus produk fashion atau butik dari pada berbelanja produk fashion di department stores (Ramayana, Matahari, Centro dsb.)	1	2	3	4	5	6
4. Jika saya harus memilih, saya lebih memilih berproduk fashion berdasarkan fashion/mode daripada kenyamanan.	1	2	3	4	5	6
5. Saya mengikuti perkembangan trend fashion terkini di setiap tahunnya.	1	2	3	4	5	6

### Evaluasi Positive Emotion

***Petunjuk:*** Berilah penilaian Saudara berkenaan dengan perasaan saudara ketika berbelanja produk fashion dengan **MENYILANG** atau **MELINGKARI** angka yang sesuai:

<b>1. = Sangat Tidak Setuju (STS)</b>	<b>3. = Agak Tidak Setuju (ATS)</b>	<b>5.= Setuju</b>
<b>2. = Tidak Setuju (TS)</b>	<b>4. = Agak Setuju (AS)</b>	<b>6.= Setuju Sekali</b>

Pengukuran Positive Emotion	Sama Sekali Tidak Setuju			Sangat Setuju		
	STS	TS	ATS	AS	S	SS
1. Saya merasa bahagia ketika berbelanja produk fashion	1	2	3	4	5	6
2. Saya merasa puas setelah berbelanja produk fashion	1	2	3	4	5	6
3. Saya merasa gembira ketika berbelanja produk fashion	1	2	3	4	5	6
4. Saya merasa semangat ketika berbelanja produk fashion	1	2	3	4	5	6
5. Berbelanja produk fashion meningkatkan penghargaan terhadap diri saya sendiri.	1	2	3	4	5	6

## Evaluasi Hedonic Consumption Tendency

***Petunjuk:*** Berilah penilaian Saudara berkenaan dengan kecenderungan saudara mendapatkan kepuasan hedonism saat berbelanja produk fashion dengan **MENYILANG** atau **MELINGKARI** angka yang sesuai:

<b>1. = Sangat Tidak Setuju (STS)</b>	<b>3. = Agak Tidak Setuju (ATS)</b>	<b>5.= Setuju</b>
<b>2. = Tidak Setuju (TS)</b>	<b>4. = Agak Setuju (AS)</b>	<b>6.= Setuju Sekali</b>

Pengukuran Hedonic Consumption Tendency	Sama Sekali Tidak Setuju			Sangat Setuju		
	STS	TS	ATS	AS	S	SS
1. Saya berbelanja produk fashion karena saya penasaran dengan produk fashion yang dijual.	1	2	3	4	5	6
2. Saya berbelanja produk fashion karena saya ingin mencoba produk fashion yang baru.	1	2	3	4	5	6
3. Saya berbelanja produk fashion karena saya ingin memiliki produk fashion yang berbeda.	1	2	3	4	5	6
4. Berbelanja produk fashion merupakan salah satu alternative mengisi waktu luang.	1	2	3	4	5	6
5. Bagi saya berbelanja produk fashion merupakan aktifitas yang menyenangkan.	1	2	3	4	5	6

### Evaluasi Fashion-oriented Impulse Buying

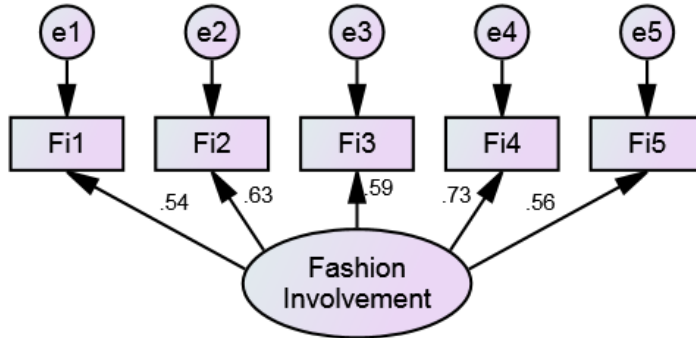

***Petunjuk:*** Berilah penilaian Saudara berkenaan dengan kecenderungan saudara membeli produk fashion secara impulsive/tanpa rencana dengan **MENYILANG** atau **MELINGKARI** angka yang sesuai:

<b>1. = Sangat Tidak Setuju (STS)</b>	<b>3. = Agak Tidak Setuju (ATS)</b>	<b>5.= Setuju</b>
<b>2. = Tidak Setuju (TS)</b>	<b>4. = Agak Setuju (AS)</b>	<b>6.= Setuju Sekali</b>

Pengukuran Fashion-oriented Impulse Buying	Sama Sekali Tidak Setuju			Sangat Setuju		
	STS	TS	ATS	AS	S	SS
1. Jika saya melihat produk fashion dengan model baru, saya akan tertarik untuk membeli produk fashion tersebut.	1	2	3	4	5	6
2. Saya membeli produk fashion untuk mencoba fitur terbaru (bahan, style, dsb.) dari produk fashion tersebut.	1	2	3	4	5	6
3. Saya suka membeli produk fashion yang baru muncul di pasaran.	1	2	3	4	5	6
4. Terkadang saya membeli produk fashion yang tidak saya rencanakan.	1	2	3	4	5	6
5. Saya merasa senang ketika melihat model-model baru produk fashion yang saya temukan di pasaran.	1	2	3	4	5	6

**Models**

**Default model (Default model)**

**Notes for Model (Default model)**

**Computation of degrees of freedom (Default model)**

Number of distinct sample moments: 210  
Number of distinct parameters to be estimated: 62  
Degrees of freedom (210 - 62): 148

**Result (Default model)**

Minimum was achieved

Chi-square = 172.983

Degrees of freedom = 148

Probability level = .078

## APPENDIX D

### DESCRIPTIVE ANALYSIS OUTPUT

**Berapa jumlah pakaian (baju, celana, jaket, sepatu, & aksesoris) yang anda beli di setiap tahun?**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid < 5 buah	49	22.4	22.4	22.4
> 10 buah	101	46.1	46.1	68.5
5 - 10 buah	69	31.5	31.5	100.0
Total	219	100.0	100.0	

**Apa jenis kelamin Saudara ?**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Laki-laki	90	41.1	41.1	41.1
Perempuan	129	58.9	58.9	100.0
Total	219	100.0	100.0	

**Berapakah usia Saudara pada ulang tahun terakhir ?**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid < 20 tahun	6	2.7	2.7	2.7
> 22 tahun	91	41.6	41.6	44.3
20 - 22 tahun	122	55.7	55.7	100.0
Total	219	100.0	100.0	

**Berapakah penghasilan/uang sanga per-bulan saudara?**

	Frequency	Percent	Valid Percent	Cumulative Percent
< Rp.1,000,000	70	32.0	32.0	32.0
> Rp. 3,000,000	60	27.4	27.4	59.4
Rp. 1,000,000 - Rp. 1,499,999	21	9.6	9.6	68.9
Valid Rp. 1,500,000 - Rp. 1,999,999	34	15.5	15.5	84.5
Rp. 2,000,000 - Rp. 2,499,999	19	8.7	8.7	93.2
Rp. 2,500,000 - Rp. 3,000,000	15	6.8	6.8	100.0
Total	219	100.0	100.0	

**Dimana tempat anda sedang/telah menempuh ilmu?**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Universitas Negeri	69	31.5	31.5	31.5
Universitas Swasta	150	68.5	68.5	100.0
Total	219	100.0	100.0	

**Apa prodi yang sedang/telah anda tempuh?**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Ilmu non-sosial	133	60.7	60.7	60.7
Ilmu sosial	86	39.3	39.3	100.0
Total	219	100.0	100.0
